Get the facts. Get the recipes. Eat your way to wellbeing. From increasing your vitality and boosting your brainpower to losing weight and preventing disease - these fifty familiar ingredients have a whole range of positive effects on women's health. They taste pretty great, too. Naturopath Emma Sutherland and home economist Michelle Thrift have teamed up and drawn on their extensive experience to give you the lowdown on how the foods we eat can change our lives. With comprehensive information on the nutrients, vitamins, minerals and all the other good stuff, along with more than 250 ways to get the ingredients into your everyday diet - from handy tips to easy recipes - you have everything you need to make the right food choices for you. 'For a start ... it's lovely to look at. Second, although each of the 50 ingredients is given a write-up listing its various health benefits ... the tone is far from preachy. Sutherland, a naturopath, and Thrift, a home economist, simply share the information and then tell you ways you can use it to your advantage.' The Weekend West '...it's sure to change the lives of thousands of women.' Taste

This handbook is an invaluable resource for improving the management of diabetes. Chapters cover the fundamentals, including epidemiology, history and physical examination, and functional evaluations. Diabetes in children, adolescents, adults, and geriatrics are addressed. Differential diagnosis is emphasized, and evidence-based guidelines and patient-specific considerations aid the reader with injury evaluation and care. Notably, the book highlights the importance of understanding diabetic symptoms when determining the source of illnesses. In addition, the text presents the spectrum of treatment options for diabetes. The book is complete with appendices that explain the evidence-based approach used throughout and the science behind therapeutic modalities.

From the Basics to Advanced techniques 3rd Edition for 2016 is New and Greatly Expanded with over 120 pages of text, graphics and illustrations to help you start IVs! Intravenous cannulation is one of the most difficult skills most RNs, LVNs and EMTs will learn. If you are scared out of your mind about starting IVs, you are not alone. It is an invasive and often painful procedure that requires both skill and practice to master. Maybe you are worried about hurting your patient. Or perhaps you are afraid of appearing incompetent in front of the patient if you are unsuccessful. All too often it seems easier to just ask someone else. Like any skill, some will be better than others. Some will learn faster, others it will take more time. Our goal is to provide you a RAPID and EASY way to master the IV stick! Not everyone will become an expert, and that's OK. But at a minimum, we want to impart every professional with the skill and confidence to start a routine, uncomplicated IV in their patient. Whether you are a new-grad who needs the essentials or a seasoned professional looking to learn some advanced techniques, everyone can always learn something new. Basics to Advanced Techniques Over 120 pages of text, graphics and pictures Gaugeschoosing the correct gauge Basic anatomy and physiology of veins Strategies to distend veins and make them Pop Out! How to choose veins which to avoid A colorful, illustrated step-by-step guide to starting a standard IV 4 methods to threading the catheter 3 approaches to inserting the needle Guide to the 'Floating technique' Visual guide to what you are doing wrong when a vein blows Finding and avoiding valves The Y-Bifurcation Inserting IVs in the elderly Vesicant medications Assortment of tips and tricks By the end you will have not just the skills to start an IV, but the confidence to go out there and give each patient your two best shots. Example Chapter Threading the catheter At this point both the tip

of the needle and the tip of the catheter are inside the vein. You will now need to thread the rest of the catheter into the vein. The catheter is fully inside the vein when only the hub sticks out. There are several different methods to advancing the catheter The Two Handed Technique 1.You have already visualized flash, lowered your angle, advanced 1-2mm and released the tourniquet. 2.Continue holding the needle in place 3.With your non-dominant hand, grasp the hub of the catheter and slide it forward into the vein 4.Slowly withdraw the needle 5.Place your thumb on the hub of the catheter to hold it in place 6.Use your index finger to press down above the site to prevent blood from spilling out The Single Handed Technique 1.You have already visualized flash, lowered your angle, advanced 1-2mm and released the tourniquet. 2.Continue holding the needle in place. 3.Use the index finger of the hand that is holding the needle to slide the catheter past the needle 4.Continue sliding the catheter until it is fully inside the vein. With the above two techniques, be careful that you are only advancing the catheter into the vein and not the needle. If the catheter is inside the vein it should be relatively easy and painless to advance it. Unlike the needle, the catheter is soft and flexible so it will be difficult to slide it in unless you are inside the vein. If the flashback was very small, you may feel resistance... Introduction -- Meet your IV device -- Know your veins -- Make them pop out -- Selecting your site -- Sites to avoid -- Equipment -- Standart technique step-by-step -- The floating technique -- Veins that blow -- Valves -- Venipuncture in elderly patients - - Infiltration and extravasation -- Tips and tricks -- End -- Appendix.

Are you a healthcare worker who has been assaulted, or know someone who has? Violence against healthcare workers has reached epidemic levels, and emergency nurses are particularly at risk. Assaults on healthcare staff are leading to life-changing injuries, PTSD, and even death. According to the American Nurses Association, workplace violence is one of the most complex and dangerous occupational hazards facing nurses working in today's health care environment. With this epidemic of violence increasing, nurses often perceive it as part of their job. Author Sheila Wilson, RN, BSN, MPH, has worked as a nurse for over 40 years, including 17 years in the ER environment. Within her career, she has been a direct witness to, and victim of, violent assault. Since co-founding Stop Healthcare Violence in 2009, Sheila has dedicated ongoing efforts to public outreach and education surrounding the growing pandemic of healthcare violence, supporting victims of assault, and lobbying for legislative change. This ebook helps healthcare providers identify potentially dangerous situations, protect and advocate for themselves, learn what employers and administrators can and should do to mitigate workplace violence, and understand something very important: being a victim of assault is not acceptable, and it is not within your job description. "Working as individuals as well as collaboratively, it is possible to harness and diminish this frightening and growing epidemic of violence against healthcare providers."

Chemical Engineering Design, Second Edition, deals with the application of chemical engineering principles to the design of chemical processes and equipment. Revised throughout, this edition has been specifically developed for the U.S. market. It provides the latest US codes and standards, including API, ASME and ISA design codes and ANSI standards. It contains new discussions of conceptual plant design, flowsheet development, and revamp design; extended coverage of capital cost estimation, process costing, and economics; and new chapters on equipment selection, reactor design, and solids handling processes. A rigorous pedagogy assists learning, with detailed worked examples, end of chapter exercises, plus supporting data, and Excel spreadsheet calculations, plus over 150 Patent References for downloading from the companion website. Extensive instructor resources, including 1170 lecture slides and a fully worked solutions manual are available to adopting instructors. This text is designed for chemical and biochemical engineering students (senior undergraduate year, plus appropriate for capstone design courses where taken, plus

graduates) and lecturers/tutors, and professionals in industry (chemical process, biochemical, pharmaceutical, petrochemical sectors). New to this edition: Revised organization into Part I: Process Design, and Part II: Plant Design. The broad themes of Part I are flowsheet development, economic analysis, safety and environmental impact and optimization. Part II contains chapters on equipment design and selection that can be used as supplements to a lecture course or as essential references for students or practicing engineers working on design projects. New discussion of conceptual plant design, flowsheet development and revamp design Significantly increased coverage of capital cost estimation, process costing and economics New chapters on equipment selection, reactor design and solids handling processes New sections on fermentation, adsorption, membrane separations, ion exchange and chromatography Increased coverage of batch processing, food, pharmaceutical and biological processes All equipment chapters in Part II revised and updated with current information Updated throughout for latest US codes and standards, including API, ASME and ISA design codes and ANSI standards Additional worked examples and homework problems The most complete and up to date coverage of equipment selection 108 realistic commercial design projects from diverse industries A rigorous pedagogy assists learning, with detailed worked examples, end of chapter exercises, plus supporting data and Excel spreadsheet calculations plus over 150 Patent References, for downloading from the companion website Extensive instructor resources: 1170 lecture slides plus fully worked solutions manual available to adopting instructors

Nurses and paramedics pass down intravenous skills to new employees as best they can, but the fine details are often missed or forgotten. Bob Rynecki, a registered nurse and an award-winning paramedic, wrote this guide so you can establish peripheral intravenous lines easily and effectively. Taking a no-frills approach, he delivers the tricks and tips that will enable you to: - become the go-to person for starting difficult IVs; - boost your confidence no matter what your level of experience; - succeed on the first stick - almost every time. Many medical professionals desperately need to learn this basic skill because it's so often overlooked in school. Many students practice starting an IV on an anatomical arm with bulging veins that doesn't mesh with what they most often find at the bedside or in the field. Drawing upon his nineteen years of experience as a bedside critical care nurse and his fifteen years of experience as an EMT/Paramedic, Rynecki shares personal stories and examples that will help you succeed in even the most challenging circumstances. Whether you're a novice or veteran clinician, you'll improve your proficiency at initiating lifelines with *The Art of the IV Start*.

Designed for existing courses within the MA curricula, this text provides initial preparation for the principles and techniques of intravenous therapy. Students will learn the basic knowledge necessary to safely and precisely administer basic IV fluids and medications within the scope of practice for their particular health care profession. Each chapter is organized with chapter outlines, learning objectives, key words with definitions, and chapter summaries. Includes a basic review of anatomy and physiology to provide a fundamental understanding of how IV therapy can interact with each body system. A variety of exercises (such as IV calculations or patient teaching) are integrated within each chapter to reinforce the learning of often-difficult concepts. Includes an array of worksheets on the companion Evolve website (such as drugs, charting, or drug and dosage calculations) to provide practice tools for the student. Each chapter concludes with multiple-choice review questions to test students' knowledge of the content within that chapter. Provides a Competency Check Sheet with standards for performance and to meet competency-based education requirements.

This Open access book offers updated and revised information on vessel health and preservation (VHP), a model concept first published in poster form in 2008 and in JVA in 2012, which has received a great deal of attention, especially in the US, UK and Australia. The book presents a model and a new way of thinking applied to vascular access and administration of intravenous treatment, and shows how establishing and maintaining a route of access to the bloodstream is essential for patients in acute care today. Until now, little thought has been given to an intentional process to guide selection, insertion and management of vascular access devices (VADs) and by default actions are based on crisis management when a quickly selected VAD fails. The book details how VHP establishes a framework or pathway model for each step of the patient experience, intentionally guiding, improving and eliminating risk when possible. The evidence points to the fact that reducing fragmentation, establishing a pathway, and teaching the process to all stakeholders reduces complications with intravenous therapy, improves efficiency and diminishes cost. As such this book

appeals to bedside nurses, physicians and other health professionals.

The United States is among the wealthiest nations in the world, but it is far from the healthiest. Although life expectancy and survival rates in the United States have improved dramatically over the past century, Americans live shorter lives and experience more injuries and illnesses than people in other high-income countries. The U.S. health disadvantage cannot be attributed solely to the adverse health status of racial or ethnic minorities or poor people: even highly advantaged Americans are in worse health than their counterparts in other, "peer" countries. In light of the new and growing evidence about the U.S. health disadvantage, the National Institutes of Health asked the National Research Council (NRC) and the Institute of Medicine (IOM) to convene a panel of experts to study the issue. The Panel on Understanding Cross-National Health Differences Among High-Income Countries examined whether the U.S. health disadvantage exists across the life span, considered potential explanations, and assessed the larger implications of the findings. U.S. Health in International Perspective presents detailed evidence on the issue, explores the possible explanations for the shorter and less healthy lives of Americans than those of people in comparable countries, and recommends actions by both government and nongovernment agencies and organizations to address the U.S. health disadvantage.

This essential publication focuses on what the CMA needs to know about intravenous infusion therapy. Infusion or IV therapy has long been part of the acute care of patients. However, more patients are receiving IV therapy at home, in emergency centers, at infusion centers, and in dialysis clinics. Thus, CMAs often need to understand IV therapy to lay out the equipment, to monitor the patient, to assess the infusion site, to discontinue the infusion, and perhaps even to insert the IV. The purpose of this book is to help you understand the theory of IV therapy. With patient safety in mind, risks, complications, and adverse reactions are discussed in *Intravenous Infusion Therapy for Medical Assistants*. Giving the correct medication is crucial to the CMA, so intravenous infusion preparations are compared and contrasted. Sidebars of Medical Assisting Alerts and Tips are distributed throughout the text to highlight key safety concerns and professional issues. Each chapter concludes with Review Questions and Activities to ensure that learning objectives have been met.
