This book comprises the select proceedings of the national-level conference on Sustainable Waste Management Practices (SWMP 2023). The content focuses on industrial wastewater treatment, solid and hazardous waste management, municipal/plastic/biom edical/construction and demolition waste management, e-waste management, leachate treatment, case studies on best practices, among others for waste management. This book is of immense interest to researchers in academia and industry working in the fields of environmental and civil engineering.
Draft Environmental

Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-level Radioactive Waste at Yucca Mountain, Nye County, Nevada: Impact analyses National Academies Press
A practical guide for the identification and management of a range of hazardous wastes, *Waste Management Practices: Municipal, Hazardous, and Industrial* integrates technical information including chemistry, microbiology, and engineering, with current regulations. Emphasizing basic environmental science and related technical fields, the book is an **Impact Statement for a Geologic Repository for the Disposal of Spent Nuclear Fuel and High-level Radioactive Waste at Yucca Mountain, Nye County, Nevada: Impact** analyses National Academies Press

To complement the growing body of knowledge on the physical aspects of radioactive waste disposal, this new report identifies the "socioeconomic and institutional" policy issues that must be addressed in implementing the Nuclear Waste Policy Act. Site location, transportation modes, disposal schedules, regulatory systems, and the effects of

these systems on the people living near the sites and along the transportation routes are addressed.

Nature

A complete overview of sources of radioactive waste, this book highlights the issues involved in safe transportation and decontamination as well as in decommissioning of nuclear facilities. It covers radioactive decay and radiation shielding calculations, management and disposal of spent nuclear fuel and high level-waste, low-level waste, transuranic waste, Uranium mill tailings, and mixed waste. It discusses technical and regulatory aspects of

waste management and provides a look at historical record and its influence on current policy.

Tank Closure and Waste Management for the Hanford Site

Savannah River Plant, Aiken, Waste Management Activities for Groundwater Protection Social and Economic Aspects of Radioactive Waste Disposal

February issue includes Appendix entitled Directory of United States Government periodicals and subscription publications; September issue includes List of depository libraries; June and December issues include semiannual index *Solid Waste Management*

In the transport of

radioactive material (RAM), e.g., spent nuclear fuel (SNF), stakeholders are generally most concerned about risks in high population density areas along transportation routes because of the perceived high consequences of potential accidents. The most significant portions of a transcontinental route and an alternative examined previously were evaluated again using population density data derived from US Census Block data. This method of characterizing population that adjoins route segments offers improved resolution of population density variations, especially in high population density areas along typical transport routes.

Calculated incident free doses and accident dose risks for these routes, and the rural, suburban and urban segments are presented for comparison of their relative magnitudes. The results indicate that modification of this route to avoid major metropolitan areas through use of non-Interstate highways increases total risk yet does not eliminate a relatively small urban component of the accident dose risk. This conclusion is not altered by improved resolution of route segments adjoining high density populations.

Hazardous Materials, Hazardous Waste

This report, a supplement to Appendix E

(Transportation Risk) of the U.S. Department of Energy Waste Management Programmatic Environmental Impact Statement (WM PEIS), provides additional information supporting the accident data for chemical risk assessment and health risk methodology described in that appendix (Part II) and presents the uncertainty analysis and on-site risk calculations. This report focuses on hazardous material truck accident rates, release probabilities, and release quantities; provides the toxicological values derived for each hazardous chemical assessed in the WM PEIS and further details on the derivation of health criteria;

describes the method used in the transportation risk assessments to address potential additivity of health effects from simultaneous exposure to several chemicals and the method used to address transportation risks for maximally exposed individuals; presents an expanded discussion of the uncertainty associated with transportation risk calculations; and includes the results of the on-site transportation risk analysis. In addition, two addenda are provided to detail the risk assessments conducted for the hazardous components of low-level mixed waste (Addendum I) and transuranic waste (Addendum II).
