 Operational amplifiers play a vital role in modern electronics design. The latest op amps have powerful new features, making them more suitable for use in many products requiring weak signal amplification, such as medical devices, communications technology, optical networks, and sensor interfacing. The Op Amp Applications Handbook may well be the ultimate op amp reference book available. This book is brimming with up-to-date application circuits, valuable design tips, and in-depth coverage of the latest techniques to simplify op amp circuit designs, and improve their performance. As an added bonus, a selection on the history of op amp development provides an extensive and expertly researched overview, of interest to anyone involved in this important area of electronics. \* Seven major sections packed with technical information \* Anything an engineer will want to know about designing with op amps can be found in this book \* Op Amp Applications Handbook is a practical reference for a challenging engineering field.

This book, which is divided into three parts, gives a state-of-the-art report on technical developments in instrumentation and on theoretical advancements in acoustic remote sensing. It explains the utilization of acoustic techniques in studies related to the structure of the lower atmosphere and oceans and discusses various atmospheric and oceanic applications. The potential and limitations of acoustic remote sensing are also described. This book will be useful to researchers, graduate students, and teachers interested in the structure of the atmosphere and oceans.

A program was initiated at the Air Force Geophysics Laboratory to develop an automated system to provide accurate and timely measurements of temperature/dew point, winds, precipitation, pressure, visibility, and cloud height in a tactical base-airfield environment. An assessment was made of available meteorological sensors to determine their suitability to satisfy the requirements of such a system. Potential candidate sensors have been identified in all areas with the exception of visibility and cloud height. Under the current effort the following were completed: (1) translators were designed and built for AWS wind and temperature/dew point measuring sets in order to provide for automated operation; (2) intercomparison testing of a number of precipitation gages was performed; (3) a hand-held laser rangefinder was evaluated for use as a cloud height measuring device; (4) a prototype tactical visibility meter (TVM) was designed, fabricated, and tested; and (5) the development of a preproduction version of the tactical visibility meter was initiated.
