## **KLEIN ADRIEL**

---

### **Advances in HIV Treatment** Springer Science & Business Media

An extensive assessment of combination therapy of AIDS. Main focus is put on the Highly Active Antiretroviral Therapy (HAART) but other therapies like salvage therapy are also discussed. The chapters cover efficacy, treatment, causes of treatment failure, clinical care, guidelines, pharmacology. The volume closes with an outlook on future perspectives.

### Primary HIV Infection PMPH-USA

A magisterial survey of all aspects of the reverse transcriptase inhibitors (RTIs) used to treat HIV/AIDS, including drug discovery, pharmacology, development of drug resistance, toxicity, and prevention of mother-to-child transmission of HIV/AIDS. The authors synthesize our current understanding of the role of reverse transcriptase in the viral life cycle, describe the discovery and development of eight nucleoside and nucleotide analogs that represent milestones in treatment history, and thoroughly discuss the question of toxicity and resistance to this class of drugs. They also address three non-nucleoside RTIs and their pharmacokinetics and comparative clinical efficacy, new RTIs currently under development, and the impact of approved agents on treatment, in general, and on vertical transmission in the developing world.

### HIV/AIDS Treatment Drugs Springer Science & Business Media

The Social Security Administration (SSA) uses a screening tool called the Listing of Impairments to identify claimants who are so severely impaired that they cannot work at all and thus qualify for disability benefits. In this report, the Institute of Medicine (IOM) makes several recommendations for improving SSA's capacity for determining disability benefits more accurately and quickly using the HIV Infection Listings.

### **HIV and the Brain** Jones & Bartlett Publishers

An estimated forty million people carry the human immunodeficiency virus (HIV), and five million more become newly infected annually. In recent years, many HIV-infected patients in wealthy nations have enjoyed significantly longer, good-quality lives as a result of antiretroviral therapy (ART). However, most infected individuals live in the poorest regions of the world, where ART is virtually nonexistent. The consequent death toll in these regions—especially sub-Saharan Africa—is begetting economic and social collapse. To inform the multiple efforts underway to deploy antiretroviral drugs in resource-poor settings, the Institute of Medicine committee was asked to conduct an independent review and assessment of rapid scale-up ART programs. It was also asked to identify the components of effective implementation programs. At the heart of the committee's report lie five imperatives: Immediately introduce and scale up ART programs in resource-poor settings. Devise strategies to ensure high levels of patient adherence to complicated treatment regimens. Rapidly address human-resource

shortages to avoid the failure of program implementation. Continuously monitor and evaluate the programs to form the most effective guidelines and treatment regimens for each population. Prepare to sustain ART for decades.

HIV and Disability World Health Organization

During the last 5 years, major advances have been made in our understanding of the pathogenesis of human immunodeficiency virus (HIV) disease and in the development of new potent antiviral agents. With regard to HIV pathogenesis, several recent observations have not only changed our perspectives of HIV disease, but have been critical for the design of therapeutic strategies.

*Updates in HIV and AIDS: Part I, An Issue of Infectious Disease Clinics*, African Books Collective

Examines conspiracy theories surrounding HIV and AIDS, focusing on two main widely believed falsehoods-- that America manufactured AIDS to be a biological weapon and the belief that HIV is harmless and the true cause of AIDS are antiretroviral drugs.

*The New Era of AIDS* Birkhäuser

This book collects studies performed mainly with the support of the Agence Nationale de Recherche contre le Sida (French National Agency of Research against AIDS). The purpose is to analyse the conditions to improve access to drugs against AIDS in developing countries, to urge on international agencies determinedly support patients treatment. The first part deals with the market of antiretrovirals and patents : How the prices drop took place in 1998-2002, what were the debates about Intellectual Property Rights and WTO, what happened in countries as Brazil and Thailand? The

second part deals with the impact of AIDS epidemic in the developing world and the role of therapeutic strategies to lower this impact. The book backs up the argument that the impact has been underestimated and these strategies are feasible.

Disease Control Priorities, Third Edition (Volume 6) Springer Science & Business Media

This book focuses on some of the new clinical and biological insights related to HIV-associated metabolic and cardiovascular complications in the HAART era. The introduction of highly active antiretroviral therapy (HAART) has altered cardiovascular manifestations in HIV. On the one hand, HAART has significantly improved the quality of life of HIV-infected patients. On the other hand, the early data have raised some concerns, creating an intriguing clinical scenery.

*Cardiovascular Disease in AIDS* Bentham Science Publishers

This technical guide examines the elements required to establish and ensure continuity of supplies, including HIV/AIDS medicines and other commodities, for programs scaling up antiretroviral therapy (Art) and associated health services. It provides extensive guidance on key topics: Quality Assurance, Selection & Quantification methods, Intellectual Property Rights, Procurement Strategies, Pricing & Financing, the Supply Cycle and Policy Issues.

*Treatment of AIDS* Academic Press

The world's leading experts provide all the 'Essentials' needed to manage patients in the office, on the ward, and in the ICU. Completely revised and updated, HIV Essentials 2013 incorporates the latest clinical guidelines into a step-by-step guide to the

diagnosis, evaluation, management, and prevention of HIV infection and its complications. Topics include: opportunistic infections and other HIV complications, treatment of HIV and pregnancy, antiretroviral drug summaries, post-exposure prophylaxis, as well as commercially available dosage forms for all ARVs. Important Notice: The digital edition of this book is missing some of the images or content found in the physical edition

**HIV and Liver Disease** World Health Organization

Liver disease has been identified as a leading cause of death in HIV-infected patients since the introduction of highly active antiretroviral therapy (HAART) in 1996. The HIV treatment community has been caught largely unaware of this emerging dilemma. Many HIV care providers are ill-equipped to understand and interpret liver injury patterns, or to provide comprehensive care and management for viral coinfections which they are not familiar with. HIV and Liver Disease provides a comprehensive update of the field covering the epidemiology, pathogenesis, management and treatment of liver disease in patients with HIV infection. The volume will help HIV care providers understand and interpret liver injury patterns, and/or provide comprehensive care and management for viral coinfections. Gastroenterologists and hepatologists will gain an understanding of complex drug regimens that are used to treat HIV and which may impact HCV and HBV treatment. Written by expert clinicians and researchers across multiple disciplines, HIV and Liver Disease will be of great value to gastroenterologists, hepatologists, infectious disease practitioners, as well as other health care providers who

provide care or participate in research in the field of HIV.

**Medication Adherence in HIV/AIDS**

World Bank Publications

This book focuses on some of the new clinical and biological insights related to HIV-associated metabolic and cardiovascular complications in the HAART era. The introduction of highly active antiretroviral therapy (HAART) has altered cardiovascular manifestations in HIV. On the one hand, HAART has significantly improved the quality of life of HIV-infected patients. On the other hand, the early data have raised some concerns, creating an intriguing clinical scenery.

*For Adult HIV Patients on Highly Active Antiretroviral Therapy, Will Continuation Or Initiation of Therapy in Intensive Care Units Improve Patient Outcome During Hospitalization when Compared to Patients Not Receiving Therapy* World Health Organization

Histoplasmosis is a disease caused by the fungus *Histoplasma capsulatum*. This disease is highly endemic in some regions of North America, Central America, and South America and is also reported in certain countries of Asia and Africa. It often affects people with impaired immunity, including people living with HIV, among whom the most frequent clinical presentation is disseminated histoplasmosis. The symptoms of disseminated histoplasmosis are non-specific and may be indistinguishable from those of other infectious diseases, especially disseminated tuberculosis (TB), thus complicating diagnosis and treatment. Histoplasmosis is one of the most frequent opportunistic infections caused by fungal pathogens among people living with HIV in the Americas and may be responsible for 5-15% of AIDS-related

deaths every year in this Region. These guidelines aim to provide recommendations for the diagnosis, treatment, and management of disseminated histoplasmosis in persons living with HIV. Although the burden of disease is concentrated in the Americas, the recommendations presented within these guidelines are applicable globally. These guidelines were produced in accordance with the World Health Organization (WHO) handbook for guideline development. The Guideline Development Group elaborated the final recommendations based on a systematic review of scientific literature and critical evaluation of the evidence available using the Grading of Recommendations, Assessment, Development, and Evaluation (GRADE) approach. These guidelines are intended for health-care providers, HIV program managers, policy-makers, national treatment advisory boards, researchers, and other professionals involved in caring for people who either have or may be at risk of developing disseminated histoplasmosis.

**Expanding Access to HIV Treatment Through Community-based Organizations**

LAP Lambert Academic Publishing

Highly active antiretroviral therapy (HAART) is a therapeutic intervention developed by clinicians and researchers in order to fight the HIV pandemic. This book marks the tenth anniversary of HAART, and reviews both the achievements to date, and an exploration of the challenges that may arise in the future.

**The AIDS Conspiracy**

CRC Press  
A joint publication of Sidaction, the Joint United Nations Programme on HIV/AIDS (UNAIDS) and the World Health Organization

OUP Oxford

The science of the virus and its effects and the clinical approaches to its treatment and transmission prevention are placed in the context of the history and epidemiology of the HIV-AIDS pandemic. Each organ system of the body is explored as to manifestations of the disease, treatment now and in the future, as well as what the disease has taught us about the immune response. The science of epidemiology, which is so important in allowing for tracking of the disease and potential limitation of transmission, is another aspect of AIDS explored in detail. The pandemic manifests differently in different parts of the world, and the relevance of the volume is enhanced by its international group of contributors. No other text provides the historical and epidemiological context of this disease along with an update of diagnosis and treatment. The underlying science and epidemiology of AIDS are not neglected, so the student or clinician who is treating patients with AIDS can gain a full understanding of HIV/AIDS in individual patients and in their communities.

*AIDS Crisis Control in Uganda* National Academies Press

The introduction of antiretroviral therapy (ART) in middle and low income countries is arguably one of the most meaningful outcomes recorded in the fight against HIV and AIDS. A record number of some 6.2 million people living with HIV and AIDS are reported to be benefiting from the treatment, which is reported to have risen by 19 per cent between 2010 and 2011 and as a result of this, the region has also enjoyed a significant decline in AIDS mortality. This volume is the outcome of the 'call for abstracts' put out by OSSREA in 2011 for

senior researchers, social scientists and practitioners to write scientific articles on issues surrounding ARVs. The volume contains eight chapters organized into four sections: ART and quality of life; Adherence to ART; Traditional medicine and ART; and Sexual behaviour of ART attendants. The chapters are contributed by Academics and researchers from three different African countries: four from Ethiopia, two from Uganda and two from Zimbabwe.

**Antiretroviral therapy for HIV infection in infants and children**

Springer Science & Business Media  
Combination Therapy of AIDS Birkhäuser  
A Decade of HAART Columbia University Press

This title projects the future implications of three alternative AIDS treatment financing policies for the health burden of AIDS in India and for its overall health expenditures. Written by an interdisciplinary team of AIDS experts, the book presents new data on the supply and demand for antiretroviral treatment in India and new models of the epidemiological effects and the financial costs of alternative policies.

**Consolidated guidelines on HIV prevention, testing, treatment, service delivery and monitoring**

World Bank Publications  
Health of HIV Infected People: Food, Nutrition and Lifestyle with Antiretroviral Drugs provides basic and applied knowledge on the supportive roles of bioactive foods, exercise, and dietary

supplements on HIV/AIDS patients receiving antiretroviral drugs. Approaches include the application of traditional herbs and foods aiming to define both the risks and benefits of such practices. Readers will learn how to treat or ameliorate the effects of chronic retroviral disease using readily available, cheap foods, dietary supplements, and lifestyle changes with specific attention to the needs of patients receiving antiretroviral drugs. This work provides the most current, concise, scientific appraisal of the efficacy (or lack thereof) of key foods, nutrients, dietary plants, and behavioral shifts in preventing and improving the quality of life of HIV infected infants and adults, while also giving the needed attention to these complex and important side effects. Covers the role of nutrients in the prevention and treatment of HIV-induced physiological changes in children undergoing HAART, including covers of omega-3 fatty acids, dietary fat intake, metabolic changes, and vitamin D Explores food and the treatment of obesity, diabetes, and cardiovascular disease in HIV infected patients, including fundamental coverage and recommendations for care Provides coverage of fitness and exercise regimens, physical activity, and behavioral and lifestyle changes on HIV infected individuals Gives careful attention to the specific nutritional needs of patients undergoing HAART therapy
