This Handbook provides the first comprehensive international overview of significant contemporary Indigenous architecture, practice, and discourse, showcasing established and emerging Indigenous authors and practitioners from Australia, Aotearoa New Zealand, the Pacific Islands, Canada, USA and other countries. It captures the breadth and depth of contemporary work in the field, establishes the historical and present context of the work, and highlights important future directions for research and practice. The topics covered include Indigenous placemaking, identity, cultural

regeneration and Indigenous knowledges. The book brings together eminent and emerging scholars and practitioners to discuss and compare major projects and design approaches, to reflect on the main issues and debates, while enhancing theoretical understandings of contemporary Indigenous architecture. The book is an indispensable resource for scholars, students, policy makers, and other professionals seeking to understand the ways in which Indigenous people have a built tradition or aspire to translate their cultures into the built environment. It is also an essential reference for academics and practitioners working in the field of the built environment, who need up-to-date knowledge of current practices and discourse on Indigenous peoples and their architecture.

This book is developed from and includes the presentations of leading international experts and scholars in the 12-14 July, 2006 Wingspread Workshop. With urban waters as a focal point, this book will explore the links between urban water quality and hydrology, and the broader concepts of green cities and smart growth. It also addresses legal and social barriers to urban ecological sustainability and proposes practical ways to overcome those barriers. Cities of the Future features chapters containing visionary concepts on how to ensure that cities and their water resources become ecologically sustainable and are able to provide clean

water for all beneficial uses. The book links North American and Worldwide experience and approaches. The book is primarily a professional reference aimed at a wide interdisciplinary audience, including universities, consultants, environmental advocacy groups and legal environmental professionals.

Electricity is the lifeblood of modern society, and for the vast majority of people that electricity is obtained from large, interconnected power grids. However, the grid that was developed in the 20th century, and the incremental improvements made since then, including its underlying analytic foundations, is no longer adequate to completely meet the needs of the 21st century. The next-generation electric grid must be more flexible and resilient. While fossil fuels will have their place for decades to come, the grid of the future will need to accommodate a wider mix of more intermittent generating sources such as wind and distributed solar photovoltaics. Achieving this grid of the future will require effort on several fronts. There is a need for continued shorter-term

engineering research and development, building on the existing analytic foundations for the grid. But there is also a need for more fundamental research to expand these analytic foundations. Analytic Research Foundations for the Next-Generation Electric Grid provide guidance on the longer-term critical areas for research in mathematical and computational sciences that is needed for the next-generation grid. It offers recommendations that are designed to help direct future research as the grid evolves and to give the nation's research and development infrastructure the tools it needs to effectively develop, test, and use this research.

Suitable as a reference for industry practitioners and as a textbook for classroom use, *Case Studies in System of Systems, Enterprise Systems, and Complex Systems Engineering* provides a clear understanding of the principles and practice of system of systems engineering (SoSE), enterprise systems engineering (ESE), and complex systems engineering (CSE). Multiple domain practitioners present and analyze case studies from a range of applications that demonstrate underlying principles and best practices of

transdisciplinary systems engineering. A number of the case studies focus on addressing real human needs. Diverse approaches such as use of soft systems skills are illustrated, and other helpful techniques are also provided. The case studies describe, examine, analyze, and assess applications across a range of domains, including: Engineering management and systems engineering education Information technology business transformation and infrastructure engineering Cooperative framework for and cost management in the construction industry Supply chain modeling and decision analysis in distribution centers and logistics International development assistance in a foreign culture of education Value analysis in generating electrical energy through wind power Systemic risk and reliability assessment in banking Assessing emergencies and reducing errors in hospitals and health care systems Information fusion and operational resilience in disaster response systems Strategy and investment for capability developments in defense acquisition Layered, flexible, and decentralized enterprise architectures in military

systems Enterprise transformation of the air traffic management and transport network Supplying you with a better understanding of SoSE, ESE, and CSE concepts and principles, the book highlights best practices and lessons learned as benchmarks that are applicable to other cases. If adopted correctly, the approaches outlined can facilitate significant progress in human affairs. The study of complex systems is still in its infancy, and it is likely to evolve for decades to come. While this book does not provide all the answers, it does establish a platform, through which analysis and knowledge application can take place and conclusions can be made in order to educate the next generation of systems engineers.

In Operating system hardware reconfiguration: A case study for Linux, it was determined through experimentation

that a Linux-based C2 operating system can successfully undergo a hardware migration and operating system hardware reconfiguration. The direct benefit of this is the ability to forgo any new operating system reinstallation in order to support newer hardware by using mechanisms internal to the operating system that support changes in hardware; this results in a decreased waiting time for system reaccreditation and redeployment. Since an operating system can evolve over time, it can accommodate changes in the system's hardware, thus presenting a tangible advantage for the Navy as this allows the operating system to be maintained over the long-term. However, there are complexities involved when maintaining an operating system for long periods. Therefore, this report serves as an introduction and a simple methodology for performing system maintenance-related tasks that include upgrading, updating, as well as data backups and restoration. This report is neither all-inclusive nor a replacement for qualified system administrators with years of experience. Instead, it can be used as a useful source of information to provide

recommended practices, procedures, and information to help in planning for long-term system maintenance.

Rapid advances in neural sciences and VLSI design technologies have provided an excellent means to boost the

computational capability and efficiency of data and signal processing tasks by several orders of magnitude. With massively parallel processing capabilities, artificial neural networks can be used to solve many engineering and scientific problems. Due to the optimized data communication structure for artificial intelligence applications, a neurocomputer is considered as the most promising sixth-generation computing machine. Typical applications of artificial neural networks include associative memory, pattern classification, early vision processing, speech recognition, image data compression, and intelligent robot control. VLSI neural circuits play an important role in exploring and exploiting the rich properties of artificial neural networks by using programmable synapses and gain-adjustable neurons. Basic building blocks of the analog VLSI neural networks consist of operational amplifiers as electronic neurons and synthesized resistors as electronic synapses. The synapse weight information can be stored in the dynamically refreshed capacitors for medium-term storage or in the floating-gate of an EEPROM cell for long-term

storage. The feedback path in the amplifier can continuously change the output neuron operation from the unity-gain configuration to a high-gain configuration. The adjustability of the voltage gain in the output neurons allows the implementation of hardware annealing in analog VLSI neural chips to find optimal solutions very efficiently. Both supervised learning and unsupervised learning can be implemented by using the programmable neural chips.

The 'Fuzzy Logic' research group of the Microelectronics Institute of Seville is composed of researchers who have been doing research on fuzzy logic since the beginning of the 1990s. Mainly, this research has been focused on the microelectronic design of fuzzy logic-based systems using implementation techniques which range from ASICs to FPGAs and DSPs. Another active line was the development of a CAD environment, named Xfuzzy, to ease such design. Several versions of Xfuzzy have been and are being currently developed by the group. The addressed applications had basically belonged to the

control field domain. In this sense, several problems without a linear control solution had been studied thoroughly. Some examples are the navigation control of an autonomous mobile robot and the level control of a dosage system. The research group tackles a new activity with the work developed in this book: the application of fuzzy logic to video and image processing. We addressed our interest to problems related to pixel interpolation, with the aim of adapting such interpolation to the local features of the images. Our hypothesis was that measures and decisions to solve image interpolation, which traditionally had been done in a crisp way, could better be done in a fuzzy way. Validation of this general hypothesis has been done specifically in the interpolation problem of video de-interlacing. De-interlacing is one of the main tasks in video processing. *Quality Control and Reliability* CRC Press This book employs scholarly analysis to ground practical tools for applying the EU Trade Mark law (EUTM) functionality refusal grounds to address business needs when registering trade marks consisting of product characteristics. The study comprehensively examines the absolute

grounds for a refusal of registration of functional signs under EUTM. It interprets the functionality refusal grounds through objective tests, focusing on the pro-competition rationale of denying trade mark exclusivity on product features that are technically or aesthetically important for competitors' ability to trade in alternative products. The work takes a comparative approach looking at the US trade dress functionality doctrine, and a law and economics perspective on the role of trade marks and brands in the marketplace. It explores how competition rules related to market definition and the substitutability of products, as well as marketing and design findings related to branding and aesthetics, could be integrated into the legal assessment of EUTM functionality. The volume will be of interest to academics and researchers working in the areas of Intellectual Property Law, Trade Mark and Design Law, EU Law, Comparative Law, and Branding.

The form and layout of a built environment has a significant influence on crime by creating opportunities for it and, in turn, shaping community crime patterns. Effective urban planners and designers will consider crime when making planning and design decisions. A co-publication with the American Planning Association, *Crime and Planning: Building Socially Sustainable Communities* presents a comprehensive discussion of the interconnections between urban planning, criminal victimization, and crime prevention. An introduction into the main concerns at the intersection of criminology and community planning, the book first provides an overview of crime patterns. It then explores major issues within planning and their impact on crime. Critical topics discussed include connectivity, mixed-use developments, land use and zoning,

transit-oriented design, and pedestrian trails, greenways, and parks. The remaining chapters explore: Crime prevention theories Crime prevention as a central component of sustainability How to incorporate social sustainability and planning guidelines into local planning decisions Policy discussion of issues such as zoning How tools such as smart growth and form-based codes relate to crime and crime prevention Examples of how planning decisions can impact crime patterns in both a residential and retail setting, and what has already worked in real-world communities As communities continue to grapple with foreclosure, sprawl, and infill/redevelopment, a sound understanding of how the built environment impacts crime is of increasing importance. This book provides planners with the tools and knowledge necessary to minimize the impact of crime on communities with the goal of creating socially sustainable communities.
