HIMSS Dictionary of Health Information and Technology Terms, Acronyms and Organizations One-to-one Technology Device Integration in Grades 3-5 and the Beliefs & Actions of Teachers and District-level Leaders One-to-One technology initiatives began in the 1990's and have expanded over time. It

is not about distributing devices but rather how those devices transform teaching and learning. Educators need to harness the power of technology devices to engage students in learning, enhance teaching, and provide opportunities for personalized learning. The International Society for Technology in Education (ISTE) has developed student standards that provide a framework for teachers to guide them in developing content-rich lessons that are supported and

enhanced by the use of technology devices. The purpose of this study was to examine how teachers in grades three through five operationalize the seven ISTE student standards in schools with one-to-one technology devices. The types of projects designed and implemented with students, as well as the actions taken by leaders to provide systems of instructional technology support, professional development opportunities and systems for learning for teachers was explored. Data was collected through interviews with third through fifth grade teachers and leaders in two districts that have implemented one-to-one student technology devices in their schools. A qualitative design was used and data was collected from interviews with twelve leaders, six

teachers and a technology integration specialist from two school districts in the Capital Region of New York State that had implemented one-to-one initiatives in their districts. The data was analyzed to develop findings to answer three research questions. The findings of this study indicate that educational leaders who have implemented one-to-one student technology in their district recognize that it is not about the device but more about the learning. Teachers reported that one-to-one student technology devices do not replace quality instruction but rather see the devices as a tool to increase motivation and engagement. A formal assessment to gather data to determine the effectiveness of implementing one-to-one student technology devices is

needed. Conclusions from this study indicate that one-to-one student technology provide the opportunity for teachers to engage students in learning, differentiate and personalize learning, and allow students to be creators of their own learning. This study indicates that when implementing a one-to-one initiative, leaders who provide time for professional development through the creation of social networks of learning and technical support for student technology devices foster the successful implementation of a one-to-one initiative. Recommendations include supporting professional development on the ISTE standards, designing schedules that provide common time for teachers to learn about technology integration, requiring the inclusion of professional

development for technology integration in district professional development plans and teacher and leader certification programs, and future studies. Educational Technology Specialist Leading the Technology-Powered School

This IBM® Redbooks® publication is intended for IBM CICS® system programmers and IBM Z architects. It describes how to deploy and manage Java EE 7 web-based applications in an IBM CICS Liberty JVM server and access data on IBM Db2® for IBM z/OS® and IBM MQ for z/OS sub systems. In this book, we describe the key steps to create and install a Liberty JVM server within a CICS region. We then describe how to best use the different

deployment techniques for Java EE applications and the specific considerations when deploying applications that use JDBC, JMS, and the new CICS link to Liberty API. Finally, we describe how to secure web applications in CICS Liberty, including transport-level security and request authentication and authorization by using IBM RACF® and LDAP registries. Information is also provided about how to build a high availability infrastructure and how to use the logging and monitoring functions that are available in the CICS Liberty environment. This book is based on IBM CICS Transaction Server (CICS TS) V5.4 that uses the embedded IBM WebSphere® Application Server Liberty technology. It is also applicable to CICS TS V5.3 with the fixes for the continuous

delivery APAR PI77502 applied. Sample applications are used throughout this publication and are freely available for download from the IBM CICSDev GitHub organization along with detailed deployment instructions.

About This Book This book takes you on a self-guided journey of all the areas needed to understanding RFID from introduction to advanced concepts. In this book, you will find everything you need to pass the ETA RFID technical specialist exam. However, if you are just a layman trying to understand how RFID

works this book can also help you. The question and answers section detail the entire subject matter and competency covers on the actual ETA RFID exam. . An exploration of RFID from beginning to advance concept. This book tells the story of RFID and covering all the technical details from beginning to advance concepts. This book takes you from the very foundation of RFID through its architecture and communication technique, read range, and frequency selection. It explains how unique product identification can contribute to better supply chain management. RFID technology provides a means of identifying a person or object using radio frequency transmission. The technology can be used to identify, track, sort, or detect a wide variety of objects.

Communication takes place between a reader, also called an interrogator and a transponder often called a tag. Tags can either be active which is powered by a battery or passively powered by the reader radio frequency (RF) field.

According to the World Health Organization (WHO), more than 50% of vaccines produced globally lose their efficacy due to the lack of proper temperature control, logistics, or shipment-related issues. Today companies are producing smart tags that can attach to a product that integrates light, temperature, humidity sensor, a microcontroller, memory chip that can log data store in memory together with traceability data. Hospitals are now taking advantage of RFID-enabled technology to improve the management of patient and employee

safety during the pandemic. The adoption of RFID is accelerating in several sectors from retail, food production, process automation, aviation, manufacturing, and access control. RFID is currently being combined with artificial intelligence (AI) blockchain and data analytics to create even more business value. Companies like Avery Dennison are producing RFID inlays integrated with other triggers technologies to give physical items a unique identity, allowing them to connect to the internet. Companies like Ralph Lauren have partnered with real-time internet of things (IoT) solution providers and Avery Dennison to deliver digital product identity. Where solution provider Evrythny provides the cloud base infrastructure while Avery Dennison

handle product serialized label enabling products to live a digital life. Therefore, the goal of this work is to assist anyone from laymen to technicians and engineers who may want to learn more about this exciting field of RFID. The work examines the full spectrum of RFID and explains how the adoption of this technology allows greater transparency and visibility of data. After completing this book, you will have a strong foundation in RFID architecture and RFID technology integration. You will also be better prepared to pass any certification RFID exam. This includes the ETA RFID Technical Specialist Certification.
