 i>From Adam to Noah-The Numbers Game," shows that the genealogy of Adam in Genesis 5 is a

puzzle. Genesis 5 reports that people lived for over 900 years. Where are the clues that the genealogy of Genesis 5 is a puzzle? Here's the first: 1x56 years: Lamech's birth to Adam's death 2x56 + 1 years: Lamech's birth to Enoch's disappearance 3x56 years: Lamech's birth to Seth's death Here's the second clue: 416 years: Lamech's death to Kenan's death 416 years: Lamech's birth to Mahalalel's death 416 years: Enosh's death to the birth of Noah's sons And the third clue: 1x84 years: Lamech's birth to Enosh's death 2x84 + 416 years: Jared's death to Noah's death 3x84 years: Enoch's birth to Lamech's birth A collection of real human ages would never display a pattern like this. Solving the puzzle reveals a fully functional, 2500+ year old calendar that is as accurate as our modern calendar. The extracted calendar is based on a 364-day year with a 369-day leap year and a 365-day year that occurs once every 33 years. The average length of a year for this 33-year calendar is 365.242424 days which is very near the length of the vernal equinox year of 365.242374 days on which our calendar is based. It is now clear that the Bible contains science. It's ancient science, but it's real science. The Bible writers were ancient scientists and the Bible is a repository of their work. If you're a scientist, engineer or technician and you've found it impossible to take the Bible seriously, now you can. Just as we were unable to recognize

this calendar as a calendar, the science of the Bible has not been recognized as science because its' authors spoke in parables and riddles. This was a part of the Biblical culture. The book of Proverbs says that it will teach the reader how to understand the "words of the wise" which consist of proverbs, riddles and figures (puzzles). "Besides being wise, the Preacher also taught the people knowledge, weighing and studying and arranging proverbs with great care." (Ecc 12:9 RSV) "My mouth shall speak wisdom; the meditation of my heart shall be understanding. I will incline my ear to a proverb; I will solve my riddle to the music of the lyre. (Psa 49:3-4 RSV) So when Jesus taught using parables and riddles he was following a tradition that was ancient when Solomon was king. This kind of riddle extends far beyond the genealogy of Genesis 5. Genesis 1 to 11 contains a collection of riddles woven into a single fabric. The riddles continue through the book of Revelation. Once we understand these riddles we discover that the Bible actually contains a consistent, workable philosophy that can actually explain the way the world works.  The chapters in this book are based on papers presented at the 23rd Carnegie Mellon Symposia on Cognition. At this exciting event, speaker after speaker presented new discoveries about infants'

visual perception in areas ranging from sensory processes to visual cognition. The field continues to make significant progress in understanding the infant's perceptual world. Several advances have come from the development of new methods for exploring infant perception and cognition that have brought new empirical findings. Advances have also been made in understanding the mechanisms underlying perceptual development. Outstanding examples of this ongoing progress can be seen in the chapters of this volume.

This volume is the result of an interdisciplinary exchange between philosophers of identity, moral philosophers, philosophers of education, moral psychologists, and post-modern deconstructivists on the subject of personal and moral identity. This interdisciplinary character makes the book special, compared to other publications on the subject. The contributions to the first part of the book reflect on the implications of discussions in philosophy of identity for moral theory and the view of moral identity. In the second part the focus shifts to the philosophical and psychological perspectives on the concepts of self, personal and moral identity and their interrelation. It is argued that both perspectives are needed for giving an account of the emergence of moral identity as part of someone's development into a mature person. The contributions to the third part absorb the criticism of (de)constructivist theories on essentialist conceptions of personal and social identity. This book will be of interest for philosophers and psychologists active in research on identity, self, (moral) development, and related areas.

There are two creations mentioned in God's word: the first described in the book of Genesis, and the second being the natural world all around us. What is man's relationship to these creations, and how do these relate to the Creator? There are two trees in the Garden of Eden: The Tree of Life, and the Tree of the Knowledge of Good and Evil. What were their purposes then and now? Examine the Scriptures from Genesis to Revelation with Craig Christian, as he embarks with readers on a journey of discovery that reveals a third and final tree that connects many of the mysterious dots that we have all wondered about. Pairing humor with deep and fresh perspectives on creation, the fall, and salvation, readers will gain a greater understanding of the perfection of God, man's inseparable ties to creation, and awe-inspiring evidence that no detail of creation was ever completed outside of the Creator's purpose. Above all, The Third Tree contrasts God's ways with man's ways directly and simply, while demonstrating the consistency of his eternal word. When we broaden our understanding of God's perfection as expressed through his creation, and the manner in which salvation has been provided, we can only be awestruck. We can only give him glory and praise. This book will sharpen your vision and appreciation for God, his creation, and the salvation he freely offers to all.

This book is about phylogenetic diversity as an approach to reduce biodiversity losses in this period of mass extinction. Chapters in the first section deal with questions such as the way we value phylogenetic diversity among other criteria for biodiversity conservation; the choice of measures; the loss of phylogenetic diversity with extinction; the importance of organisms that are deeply branched in the tree of life, and the role of relict species. The second section is composed by contributions exploring methodological aspects, such as how to deal with abundance, sampling effort, or conflicting trees in analysis of phylogenetic diversity. The last section is devoted to applications, showing how phylogenetic diversity can be integrated in systematic conservation planning, in EDGE and HEDGE evaluations. This wide coverage makes the book a reference for academics, policy makers and stakeholders dealing with biodiversity conservation.

With the growing maturity of information and communication technologies, systems have been interconnected within growing networks, yielding new services through a combination of the system functionalities. This leads to an increasing complexity that has to be managed in order to take advantage of these system integrations. This book provides key answers as to how such systems of systems can be engineered and how their complexity can be mastered. After reviewing some definitions on systems of systems engineering, the book focuses on concrete applications and offers a survey of the activities and techniques that allow engineering of complex systems and systems of systems. Case studies, ranging from emergency situations such as Hurricane Katrina and its crisis management or a generic scenario of a major traffic accident and its emergency response, to the establishment of a scientific basis in the Antarctic region illustrate key factors of success and traps to avoid in order to cope with such situations.
