This book was written in order to help patients suffering from arthritis-related discomfort of the shoulder, hip, and/or knee joints. This book is not intended to replace the very important relationship between the patient and his or her doctor. This book is designed to assist with communication between patients and physicians. Specifically, this book will enable patients to ask highly productive questions and obtain the most useful information from their medical care providers (doctors, physicians' assistants, nurses, etc.) during their appointments or telephone conversations. The chapters are organized to cover different aspects of Arthritis and concurring treatments. There may be some overlap of information within the chapters, which is due to the intertwining nature of various arthritis treatments. The treatment options described in the book are the most up-to-date at the time this book was written. The reader should be aware that our understanding of arthritis and treatment options is constantly expanding and some of the explanations and recommendations may be out of date, even before the final publication process is completed. Nevertheless, our sincere hope is that this material will provide important knowledge to a patient suffering from arthritis and will contribute to an improved quality of life.

The introduction of total joint arthroplasty throughout the world has contributed manifold benefits to patients who suffer from joint diseases. Concurrently, however, there has been an increase in revision surgery. Many orthopedic surgeons agree that durability of prostheses is an eternal problem. In particular, periprosthetic osteolysis recently has been identified as one of the serious problems affecting prosthetic durability. To improve durability, osteolysis and many other problems must be investigated and solved both experimentally and clinically with respect to such aspects as prosthetic material, design, and biological and biomechanical behavior. This book comprises 37 papers that were presented by orthopedic surgeons and biomedical engineers at the 28th Annual Meeting of the Japanese Society for Replacement Arthroplasty, held in March 1998 in Kanazawa, Japan. The volume is thus a compilation of the latest knowledge about the pathogenesis and reduction of osteolysis and wear, newly developed total hip prostheses, and other current topics of total knee arthroplasty. We earnestly hope that this book will be of benefit to clinicians and researchers, and that it will contribute to the creation of more durable total joint prostheses in the future.
