This edited collection explores the linkages between adoption and genealogy. With its inevitable genealogical disruptions, adoption offers many interesting avenues to explore a range of psychosocial phenomena. Through both conventional research and means such as creative writing, literary criticism, and media analysis, contributors offer wide ranging perspectives on the key questions of genealogy in adoption. They do this in varied ways, reflecting different theoretical approaches and focal points on those impacted by adoption. Core issues include those of kinship, identity, and belonging. Within adoption, these link not only to personal and interpersonal experiences and relationships, but also to intersections with the workings of class, gender, sexuality, ethnicity, and nation (the latter two are often captured in debates regarding transracial and international adoption). Many important sites and modes of practice are highlighted, such as adoption searches and reunions, openness, access to records, and the community activism that is

related to these activities. Although these have long histories, they have also been evolving with the growing importance of social media, online genealogical tools, and DNA testing. Reproductive technologies have similarly evolved, and questions relating to genealogy in adoption are mirrored in relation to donor-assisted conceptions. All these important and intriguing issues are addressed in this volume.

Who is a Native American? And who gets to decide? From genealogists searching online for their ancestors to fortune hunters hoping for a slice of casino profits from wealthy tribes, the answers to these seemingly straightforward questions have profound ramifications. The rise of DNA testing has further complicated the issues and raised the stakes. In *Native American DNA*, Kim TallBear shows how DNA testing is a powerful—and problematic—scientific process that is useful in determining close biological relatives. But tribal membership is a legal category that has developed in dependence on certain social understandings and historical contexts, a set of concepts that entangles genetic information in a web of family relations, reservation histories, tribal rules, and government regulations. At a larger level, TallBear asserts, the “markers” that are identified and applied to specific groups such as Native American tribes bear the imprints of the cultural, racial, ethnic, national, and even tribal misinterpretations of the humans who study them. TallBear notes that ideas about racial science, which informed white definitions of tribes in the nineteenth century, are unfortunately being revived in twenty-first-century laboratories. Because today's science seems so compelling, increasing numbers of Native Americans have begun to believe their own metaphors: “in our blood” is giving way to “in our DNA.” This rhetorical drift, she argues, has significant consequences, and ultimately she shows how Native American claims to land, resources, and sovereignty that have taken generations to ratify may be seriously—and permanently—undermined.

Recent studies have indicated that epigenetic processes may play a major role in both cellular and organismal aging. These epigenetic processes include not only DNA methylation and histone modifications, but also extend to many other epigenetic mediators such as the polycomb group proteins, chromosomal position effects, and noncoding RNA. The topics of this book range from fundamental changes in DNA methylation in aging to the most recent research on intervention into epigenetic modifications to modulate the aging process. The major topics of epigenetics and aging covered in this book are: 1) DNA methylation and histone modifications in aging; 2) Other epigenetic processes and aging; 3) Impact of epigenetics on aging; 4) Epigenetics of age-related diseases; 5) Epigenetic interventions and aging; and 6) Future directions in epigenetic aging research. The most studied of epigenetic processes, DNA methylation, has been associated with cellular aging and aging of organisms for many years. It is now apparent that both global and gene-specific alterations occur not only in DNA methylation during aging, but also in several histone alterations. Many epigenetic alterations can have an impact on aging processes such as stem cell aging, control of telomerase, modifications of telomeres, and epigenetic drift can impact the aging process as evident in the recent studies of aging monozygotic twins. Numerous age-

related diseases are affected by epigenetic mechanisms. For example, recent studies have shown that DNA methylation is altered in Alzheimer's disease and autoimmunity. Other prevalent diseases that have been associated with age-related epigenetic changes include cancer and diabetes. Paternal age and epigenetic changes appear to have an effect on schizophrenia and epigenetic silencing has been associated with several of the progeroid syndromes of premature aging. Moreover, the impact of dietary or drug intervention into epigenetic processes as they affect normal aging or age-related diseases is becoming increasingly feasible.

Forensic genealogist, Morton Farrier, agrees to take on a case to identify the biological mother of three foundlings, abandoned in shop doorways as new-born babies in the 1970s. He has just one thing with which to begin his investigation: the three women's DNA, one of whom is his half-aunt. With just six days of research time available to him, his investigation uncovers some shocking revelations and troubling links to his own grandfather; and Morton finds that, for the first time in his career, he is advising his clients not to read his concluding report.
