Thomas Fritz presents a comprehensive review of empirical research on the creation of superior economic performance. He quantifies the competitive advantage period (CAP) and the industry advantage period (IAP) and assesses determinants of the sustainability of intra- and inter-industry performance differences.

Seminar paper from the year 2013 in the subject Economics - International Economic Relations,

grade: 2,0, University of applied sciences Frankfurt a. M., course: Advanced Business English,

language: English, abstract: Globalization is one of the major topics and challenges of our time. It

describes the process of the worldwide increasing interconnection of economy, politics, culture and

environment. This compression affects individuals, society and institutions as well as countries. It

can help to increase prosperity, social justice and global networking in order to make the world more

equal. In the following seminar paper, the prime importance will be the look at the effects of

globalization on the world economy in general. Despite the advantages of globalization, the negative

side with all the disadvantages should not be neglected. Therefore, it is essential to look at the

advantages and disadvantages that are created by globalization. The question is to ask, if

globalization really has the force to make the world more equal and who are the winners or the

losers of it ? The available seminar paper tries to answer that question with a critical analysis of the

topic. Chapter two pays attention to the fact what globalization really is and tries to identify the

major characteristics of globalization. Chapter three concentrates on the consequences and effects

of globalization on the world economy. The fourth chapter tries to identify the advantages and

disadvantages. The seminar paper ends with a short result in chapter five, providing a short

summary of the whole theme.

Public health has, for many years, been concerned with efforts to increase the efficiency of health

care delivery, to measure changes in health care resource utilization and associated costs, and to

link these changes to different types of interventions. These efforts, as well as collaboration between

biopharmaceutical organizations, producers of medical devices, and managed care and public health

organizations, have been enhanced by the opportunities created within the fast growing field of

outcomes research. This volume presents studies contributing to the enhancement of the outcomes

research paradigm by incorporating economic and social interactions within the health care delivery,

clinical decision-making and outcomes systems. A multidisciplinary team of scientists in the fields of

outcomes research, pharmacoconomics, public health, health services research, and health

economics address such complex problems as: benefits and cost of advancements in genetic

technologies; methodologies for constructing health care utilization and cost estimates; and the

effect of insurance type on resource utilization and health outcomes. Other studies consider both the

types of drugs purchased and the prices paid, pharmaceutical spending and health outcomes, incremental advantages of newer treatments, willingness to pay measurements, disease-specific impacts on human capital and quality of life, and modelling clinical trial results. One of the most important findings in this book is the description of the role of low energy in the symptomatology of depression and its strong relationship with absenteeism, work productivity and social functioning. Another paper documents the disease-specific mortality, case-fatality and annual health care utilization in diabetics and establishes the association of respiratory conditions with elevated mortality among diabetics. The work contains other papers which provide significant results in cardiovascular, infectious, central nervous system disease areas as well as in quality of life and health outcomes measurements.

Big Data's Economic Impact to raise (AI) mobile need. Big Data is beginning to have a significant impact on our knowledge of the world. This is important because increases in human knowledge have always played a large role in increasing economic activity and living standards. Continued improvements in the price and capacity of tools for collecting, transmitting, storing, analyzing and acting upon data will make it easier to gather more information and to turn it into actionable knowledge of how systems work. Big Data is best understood as an untapped resource that technology finally allows us to exploit. For instance, data on weather, insects, and crop plantings has always existed. But it is now possible to cost-effectively collect those data and use them in an informed manner. We can keep a record of every plant's history, including sprayings and rainfall. When we drive a combine over the field, equipment can identify every plant as either crop or weed and selectively apply herbicide to just the weeds. It is one good example to be used on agricultural industry aspect. So, farmers can earn more benefits when they apply big data to gather any weather, insects and crop plantings information to decide when is the suitable time to grow crop on farm any time when they touch their (AI) mobile tool in any time and anywhere very conveniently. Such new use of data has the capacity to transform every industry in similar ways. A recent OECD report listed some of the ways that more and better data will affect the economy, they may include as below: Producing new goods and services, such as the Nest home thermometer or mass customized shoes; Optimizing business processes; More-targeted marketing that injects customer feedback into product design; Better organizational management; and faster innovation through a shorter research and development cycle.

This Assignment with the topic "Which arguments are in favour respectively against joining the Eurozone from a countries perspective?" was created in the first semester "economy" module to obtain the „Master of Business Administration“. The Euro can't be evaluated independently from the EU, therefore, at first, this document gives basic information by explaining and defining the European Union (EU) and the Euro. The second part shows, instead, the advantages and disadvantages from certain perspectives. Finally it gives a summarising statement and an outlook for the future.

Today's electricity industry - large power stations feeding a nationwide grid - will soon be a thing of the past. This book explains why and what will replace it - decentralized and distributed electrical resources which can be up to 10 times as economically valuable. The authors - all leading experts in the field - explain very clearly and thoroughly all the benefits, so the engineers will understand the economic advantages and the investors will understand the engineering efficiencies. Here's what

industry experts are saying about Small is Profitable... 'A tour-de-force and a goldmine of good ideas. It is going to have a stunning impact on thinking about electricity.' Walter C. Patterson, Senior Research Fellow, Royal Institute of International Affairs, London. 'An amazing undertaking - incredibly ambitious yet magnificently researched and executed.' Dr. Shimon Awerbuch, Senior Advisor, International Energy Agency, Paris. 'Outstanding...You have thought of some [benefits] I never considered...A great resource for the innovation in energy services that will have to take place for us to have a sustainable future.' Dr. Carl Weinberg, Weinberg Associates, former Research Director, PG&E. 'This is a brilliant synthesis and overview with a lot of original analytics and insights and a very important overall theme. I think it is going to have a big impact.' Greg Kats, Principal, Capital E LLC, former Finance Director for Efficiency and Renewable Energy, U.S. Department of Energy. 'E. F. Schumacher would be proud of this rigorous extension of his thesis in Small is Beautiful. It shows how making systems the right size can make them work better and cost less. Here are critical lessons for the new century: technologies tailored to the needs of people, not the reverse, can improve the economy and the environment.' Dr. Daniel Kammen, Professor of Energy and Society and of Public Policy, University of California, Berkeley. 'Small is Profitable creates an unconventional but impeccably reasoned foundation to correctly assign the costs and true benefits of distributed energy systems. It has become an indispensable tool for modelling distributed energy systems benefits for us.' Tom Dinwoodie, CEO and Chairman, PowerLight Corporation. 'A Unique and valuable contribution to the distributed energy industry...Small Is Profitable highlights the societal benefits of distributed resources, and will be a helpful guide to policymakers who wish to properly account for these benefits in the marketplace.' Nicholas Lenssen, Senior Director, Primen. 'This book will shift the electric industry from the hazards of overcentralization toward the new era where distributed generation will rule.' Steven J. Strong, President, Solar Design Associates, Inc. 'Readers will understand why distributed resources are poised to fundamentally alter the electric power system. Its comprehensive review of the benefits of distributed resources [is] an important part of my library.' Dr. Thomas E. Hoff, President, Clean Power Research. 'The most comprehensive treatise on distributed generation.... Great job and congratulations.' Howard Wenger, Principal, Pacific Energy Group. '[D]ensely packed with information and insights...goes a long way to demonstrate that the former paradigm of electric power supply no longer makes sense.' Prof. Richard Hirsh, University of Vermont, Leading historian of the electric power sector. 'Amory Lovins was already the world's most original and influential thinker on the future of energy services in general and electricity systems in particular. This remarkable book is a very worthy addition to an extraordinary legacy.' Ralph Cavanagh, Energy Co-Director, Natural Resources Defense Council. 'This is a book every utility professional should have on the bookshelf.' Dr Peter S. Fox-Penner, Principal and Chairman of the Board, the Brattle Group, former Principal Deputy Assistant Secretary of Energy.

Essay from the year 2001 in the subject Politics - International Politics - Topic: Globalization, Political Economics, grade: ECTS-grade: B = 2, University of Leeds (Institute for Politics and International Studies), course: North-south Linkages, 18 entries in the bibliography, language: English, abstract: The posed question comprises three different issues which have to be investigated. The first thing, implied in this question is, whether or not there are more arguments for or against global free trade both in theory and in practice. Secondly, we have to ask, if real global free trade is being practised in our times. The third issue deals with the question of how we should go on in the future. Is global free trade worth being expanded or should we better tend to protectionism? In this essay I will argue that although free trade is said to cause some unintentional side-effects it is a better way of achieving economic and social development than protectionism. Most of the problems concerning free trade

only exist due to the fact, that protectionist barriers set up by Northern countries still disturb a real free trade system and therefore constitute a disadvantage for developing countries. I first want to work out the opportunities and benefits but also the challenges and problems of global free trade, as they are seen in our times. I will refer to the question of gains and losses for both, industrialised and developing countries. Firstly, I want to look at economic effects and will then turn to political and environmental issues and to the linking of the recent terror attacks with free trade. I will then ask the question how free trade is being practised today. Finally, I will sum up my results and will conclude with answering the question whether free trade is worth a greater expansion in the future or not.

Research Paper from the year 2011 in the subject Business economics - Supply, Production, Logistics, grade: B, Oxford Brookes University, language: English, abstract: The paper has been formulated in order to determine the basic differences that are present between the activity based costing (ABC) and conventional methods of costing that are used around the world. A large number of companies have converted to the ABC system since as far back as 1980 as the system has shown its usability in the appropriate product mix decision, overheads management etc. (Roztock 2000) (Reyhanoglu 2004) The benefits and drawbacks are as follows: Advantages of an Activity Based Costing System: The first and most important advantage is the accuracy in the process of costing with regards to the product line, the end-users of the product, the stock-keeping units employed by the management and the channel and category which streamline the flow of the product from the producer to the end user. This system better assists in the process of understanding the concept of overhead costs i.e. the allocation of common business resources as they are used by specific product lines and their relation to specific cost driver. The system is easy to understand and interpret as it is accessible, useable and practically implementable across all norms of business set-ups. This process uses unitary cost, or marginal cost as the computation base in contrast to the traditional cost accounting methods which employ total cost. The system works exceptionally well with quality improvement and up gradation programs e.g. Six Sigma This system is particularly helpful in identifying and ear-marking some of the matters business activities which are a burden or stress on the business i.e. wasteful or non value adding services.

Excerpt from International Trade: A Study of the Economic Advantages of Commerce Throughout, I have endeavored to keep in view the requirement of clearness, although not avoiding discussion of difficult points. To this end, concreteness has been given to the arguments presented, by the use of both hypothetical and real examples; and the main conclusions of each chapter have been summarized in the last section of the chapter. The more analytical and controversial discussions have been, in large part, confined to footnotes. I have sought thus to write a book which can serve as a text, but which may be also not without interest, on a few disputed points, to professional economists. Acknowledgment should be here made of various courtesies extended, and of the aid rendered by a number of friends who have done much toward removing errors of statement and expression and in suggesting critical and illustrative additions. Professor G. S. Calender, of the Sheffield Scientific School, Yale University, to whom I submitted the manuscript, has made a number of valuable criticisms and suggestions. I am under obligation, also, for critical reading of a number of the more important chapters of the book, to Professors Irving Fisher, Clive Day, and H. C. Emery of Yale College and to Professor John Bauer of Cornell University. Finally, I would acknowledge here the obligation I am under to my wife, who has given me valuable assistance in the gathering of data, in reading and criticising the manuscript in its various stages of completion, and in correcting the proof.
