Documents, such as drawings, memos and specifications, form an essential function in the design and construction industry. Throughout the lifecycle of a built asset, starting from an initial design idea, right through to a final built form and its ongoing management, thousands, even millions of documents can be used to convey various forms of information to a range of interested parties. In many ways, therefore, the success of a design, or construction-based company, relies upon an understanding of the use of documents, as well as the technologies and techniques that are used to create them. The Digital Document provides an extensive background to the issues and technologies surrounding this very important topic. It examines a technical subject in an insightful manner that is neither intimidating nor confusing, even to the novice computer user. By introducing the subject through a series of preliminary reviews of current practices and essential computing technologies, the reader is able to better appreciate the benefits and capabilities of a wide range of digital document types. This book explores the role of documents in a professional practice, examines the components, capabilities, viability, and use of digital documents in the design and construction industry, and identifies and explains many of the standards in use today. In order to facilitate a better understanding of digital document technologies, a number of essential reviews are provided including:

- the definition and purpose of a document
- how documents are typically used by design professionals
- the nature of the digital document environment
- the data types which make up digital documents

The Digital Document is an essential reference for the architect, engineer or design professional that wants to find out more about effective communication in the digital workplace. Bruce Duyshart is an IT Project Manager with Lend Lease Corporation and specialises in the development and implementation of digital media and information management technologies on design and construction projects. He holds a Masters degree in Architecture and is also an academic associate of the Faculty of Architecture, Building and Planning at the University of Melbourne. He has written numerous papers on emerging technologies in the architecture, engineering and construction industry, and has developed Internet web sites for the Royal Australian Institute of Architects and Architecture Media.

Networks of firms have been in the focus of management research for several years. Recently, special attention has been paid to so-called business webs. Business webs are networks of firms which provide complements to a common product architecture. In the past, research focused on management issues of such webs but neglected the important question of how they actually came into being. The present book explicitly examines the formation and early growth of business webs. The author illustrates the early growth phases with two in-depth cases of the formation of the wireless internet ecosystem i-mode and the leading person-to-person online auction platform eBay. The book uncovers the contingencies under which the establishment of business webs is likely to succeed. Business researchers will benefit from the theoretical framework, while interested business

managers will find explanations and advice for establishing a business web.

Seminar paper from the year 2004 in the subject English Language and Literature Studies - Linguistics, grade: 2,3, University of Koblenz-Landau (Anglistik), course: The Story of English, language: English, abstract: The 15th century must be seen as the age of innovation in Europe. For the spread of Renaissance culture as we know it today, several factors were decisive: advances in the fields of arts (e.g. architecture, painting and literature), science (e.g. geography, astronomy and medicine), economy (e.g. flourishing international trade) and of course technology, as the example of the printing press shows. By definition "The printing press is a mechanical device for printing many copies of a text on rectangular sheets of paper." () This definition might give the impression we are dealing with a simple gadget and a rather unspectacular procedure, but until 1450, "the original method of printing was block printing, pressing sheets of paper into individually carved wooden blocks" (), which would not last very long because of the pressure exercised upon them during the process of printing. Knowing this, the invention of the printing press seems even more valuable, as the former method described here required a lot of energy, money and time and yielded a relatively ridiculous output. A less-costly method of producing printed material needed to be found and the former goldsmith Johannes Gutenberg (1398-1468) from Mainz in Germany is acknowledged as the pioneer in this field. He experimented with metal alloy and finally created movable types which could be used and reused for printing without the effect of wearing down like the wooden material. Immediately, the printing press had the effect of multiplying the output and cutting the costs of books, thus making information available to a much larger part of the population. So it can be said that the printing press initiated an "infor

Review Office automation and associated hardware and software technologies are producing significant changes in traditional typing, printing, and publishing techniques and strategies. The long term impact of current developments is likely to be even more far reaching as reducing hardware costs, improved human-computer interfacing, uniformity through standardization, and sophisticated software facilities will all combine together to provide systems of power, capability and flexibility. The configuration of the system can be matched to the requirements of the user, whether typist, clerk, secretary, scientist, manager, director, or publisher. Enormous advances are currently being made in the areas of publication systems in the bringing together of text and pictures, and the aggregation of a greater variety of multi-media documents. Advances in technology and reductions

in cost and size have produced many 'desk-top' publishing systems in the market place. More sophisticated systems are targeted at the high end of the market for newspaper production and quality color output. Outstanding issues in desk-top publishing systems include interactive editing of structured documents, integration of text and graphics, page description languages, standards, and the human-computer interface to documentation systems. The latter area is becoming increasingly important: usability by non-specialists and flexibility across application areas are two current concerns. One of the objectives of current work is to bring the production of high quality documents within the capability of naive users as well as experts.

This text shows how the principles and technologies of object-oriented programming, distributed processing and internet protocols can be embraced to further the reliability and interoperability of datasets for the professional GIS market. The book describes the central concept of the interface specification between the data consumer and producer - the Virtual Data Set VDS. It then examines how VDS deals with two other classes of model - field representations and modelling uncertainty. The final part of the book looks at implementation, describing how the VDS interacts with PostScript, Java, and Object-oriented modelling environments.

The first edition of this dictionary, compiled by F.J.M. Wijnekus and published in 1967, was the result of years of systematic collection and preparation of thousands of terms and expressions which were until then not to be found in any other dictionary. The material was correlated for use in his daily work and, as the reputation of his private collection spread, there was an increasing demand for access to these findings. Until 1967 there was no comprehensive multilingual dictionary on the subject; former publications were incomplete and out of date and lacked clear definition - often leading to disastrous misunderstandings. Furthermore, the subject of printing, paper and ink technology had never been dealt with, in dictionary form, in relation to other aspects of the graphic industry. This new work, prepared by F.J.M. Wijnekus and his son, has been considerably up-dated. Much time has been devoted to checking the material against the most reliable and authoritative sources. The usefulness of the work has been further enhanced by the addition of Spanish and Italian to the original languages of English, French and German. The first edition was received with much enthusiastic praise and this new dictionary will undoubtedly continue to be an invaluable tool for all those working with the printed word in the widest sense. It is a reference work which should be in the hands of all those in any way connected with the printing industry, paper manufacturers, ink manufacturers, printers, bookbinders, publishers, lithographers, lay-out men and graphical research institutes.
