medical school applicants gaining admission annually. The application process is nuanced, complex, and costly, which can often be a significant barrier to otherwise highly qualified students, particularly those from backgrounds underrepresented in the healthcare workforce. Further understanding of the best practices in navigating the application processes, academia, and professional development is crucial for those advising pre-health students. The Handbook of Research on Advising and Developing the Pre-Health Professional Student considers current practices and research regarding academic and

extracurricular preparation of undergraduate students who wish to enter health professions and offers new pre-health professional advisors as well as more seasoned advisors and other administrators a resource to assist them in their professional journey. Covering a range of topics such as advisor relationships and lifelong learning skills, this major reference work is ideal for advisors, healthcare professionals, academicians, researchers, practitioners, scholars, instructors, and students.

Occupational Therapy Essentials for Clinical Competence

Psychology Press

Cognitive impairment, including deficits in memory, attention, visual perception, executive functioning, and self-awareness, is a common consequence of acquired brain injury (ABI). Subsequently, these cognitive impairments result in functional impairments in daily life activities for clients with ABI. Rehabilitation efforts are categorized under two broad approaches: remediation and

adaptation. Computer-assisted cognitive retraining (CACR) is a remediation approach using a computer platform to deliver cognitive exercises. CACR therapy can lead to improvements in memory and attention for adults with chronic ABI. However, memory and attention improvements from CACR may not carry over to functional improvements in occupational performance. Research suggested that therapy using an adaptive approach can yield functional improvements. The purpose of this project was to design a systematic cognitive retraining curriculum, Bridge/Adapt, to bridge the gap between memory- and attention-skill gains

from CACR to functional improvements in occupational performance using adaptive strategies. The Bridge/Adapt curriculum incorporates the cognitive orientation of occupational performance (CO-OP) intervention approach, multicontext approach, and goal-oriented attentional self-regulation training. The curriculum includes eight modules that provide grading options so that occupational therapists can choose which difficulty level best suits the client. Clients practice adaptive strategies during simulations of instrumental activities of daily living (IADL), including financial management,

appointment scheduling, and grocery shopping, utilizing the three themes in Bridge/Adapt: salience, context, and hierarchy. Clients use salience to choose meaningful goals to work on at home. Context refers to clients working on goals in varying environments. Lastly, clients work on tasks that increase in complexity with the hierarchical theme.
