Fundamentals of the

Examination: Patient
Interview and Tests &
Measures introduces
physical therapy students
to essential screening and

examination techniques
that form the foundation
of their practice, across all
body systems. It then
builds on the foundational
knowledge and helps
students develop clinical
decision-making skills.
Experienced clinicians
make numerous and rapid
decisions about what
questions to ask during a
patient interview, what
systems need to be
screened for problems
that lie outside the scope
of physical therapy, and
what tests and measures
must be performed during
an initial patient

examination. Physical therapy students and some new graduates often struggle with this decision-making process and answering the "why" questions. This text provides the reader with fundamental, step-by-step approach to the subjective and objective portions of the examination process for a broad spectrum of patients within the musculoskeletal, neuromuscular, integumentary, and cardiopulmonary realms (according to the Guide to

Physical Therapist Practice). Ample rationale is provided for why a test/measure would or would not be selected based on the patient's diagnosis or presentation. In addition to rationale to help with the clinical decision-making process, case examples and sample documentation will also be provided. Each new textbook includes access to an extensive array of online videos demonstrating the "how to" for a wide variety of fundamental physical therapy tests and

measures, such as gross strength testing, various sensory tests, reflex assessment, and examples of a number of abnormal gait patterns. Also included in the videos are two complete patient examinations (interview and tests/measures), one musculoskeletal and one neurological.
