Cases in Head and Neck Cancer: A  
Multidisciplinary Approach encompasses  
rich material and resources that  
demonstrate the complex interface  
between the diagnostic and clinical  
information necessary to successfully  
manage patients with head and neck

cancer. This must-read book contains cases written by leading experts in the field that cover a wide variety of head and neck cancers (i.e., tongue base, tonsil, laryngeal, HPV related, etc.) and treatment options, including minimally invasive surgery such as robotic surgery and combined modality treatment protocols. Specifically, this text addresses comprehensive cases from initial evaluation, diagnosis, imaging, and other physiological tests to

multidisciplinary treatment management (surgery, chemotherapy, and radiation therapy). Additionally, approaches for the management of toxicities or morbidities of cancer treatment are presented, as well as care plans, discharge plans, and caregiver burden and survivorship issues. Moreover, material on health literacy, humanistic care, and improving communication with assistive technology has been included. Written by clinicians specializing in speech-language pathology, otolaryngology, medical and radiation oncology, pathology, nurse case management, radiology, dietetics, among other fields, this collection of authors provides one of the most complete presentations of the inner workings of the multidisciplinary care team. The

adult cases of head and neck cancer reviewed in this text exemplify current practice issues surrounding HPV, minimally invasive robotic surgery and combined modality treatments. Each author threads introductory comments throughout the cases illustrating the critical role of the speech-language pathologist, in particular, and how all clinicians must address coping with survivorship and caregiver burden issues. Cases in Head and Neck Cancer intends to teach future medical practitioners how to approach the complexities associated with head and neck cancer. Its vast number of images and videos allow for experiential driven classroom activities. This text will be an invaluable resource for the education of speech-language pathologists, medical

students, nurse care managers, dietitians, and any person involved in a head and neck cancer team.

*Practical Essentials of Intensity Modulated Radiation Therapy* Thieme

This book brings together experts in the field of maxillofacial and head and neck oncology to provide a comprehensive clinical and translational update on oral cancer that focuses especially on prognosis. Readers will find up-to-date information on disease staging and the pathological, genetic, and surgical factors that affect patient outcomes. Individual chapters describe the most recent advances in radiotherapy, chemotherapy, and immunotherapy, again with careful analysis of the treatment-related factors relevant to response and survival. Management of

pre-malignant lesions and risk factors for malignant transformation are discussed, and the latest knowledge on chemoprevention is presented. Further topics to be addressed include reconstruction of oral cancer defects, salvage options in the event of recurrence, and the prediction of quality of life following treatment. The book will be of value to all clinicians who care for patients with oral cancer in their everyday practice.

**Carcinoma of the Oral Cavity and Oropharynx** Lippincott Williams & Wilkins

This book lays emphasis on various therapeutic approaches in head and neck cancers, including surgery, radiation therapy and photodynamic laser therapy. Other important topics

discussed are the integration of surgery/radiation therapy with chemotherapy for better patient management and feasibility of immunotherapy and gene therapy in oral cancers, outlining the different therapeutic modalities. This book makes interesting reading for both biologists and doctors in research and clinical practice.

Modern medical imaging and radiation therapy technologies are so complex and

computer driven that it is difficult for physicians and technologists to know exactly what is happening at the point-of-care. Medical physicists responsible for filling this gap in knowledge must stay abreast of the latest advances at the intersection of medical imaging and radiation therapy. This book provides medical physicists and radiation oncologists current and relevant information on Adaptive Radiation Therapy (ART), a state-of-the-art approach that uses a feedback process to account for patient-specific anatomic and/or biological changes, thus delivering highly individualized radiation therapy for cancer patients. The book should also benefit medical dosimetrists and radiation therapists. Adaptive Radiation Therapy describes

technological and methodological advances in the field of ART, as well as initial clinical experiences using ART for selected anatomic sites. Divided into three sections (radiobiological basis, current technologies, and clinical applications), the book covers: Morphological and biological biomarkers for patient-specific planning Design and optimization of treatment plans Delivery of IMRT and IGRT intervention methodologies of ART Management of intrafraction variations, particularly with respiratory motion Quality assurance needed to ensure the safe delivery of ART ART applications in several common cancer types / anatomic sites The technology and methodology for ART have advanced significantly in the last few years and accumulated clinical data

have demonstrated the need for ART in clinical settings, assisted by the wide application of intensity modulated radiation therapy (IMRT) and image-guided radiation therapy (IGRT). This book shows the real potential for supplying every patient with individualized radiation therapy that is maximally accurate and precise.

**Oral Cancer** Radiation Therapy in the Management of Cancers of the Oral Cavity and Oropharynx Oral Cancer Oral complications are hugely important for those treating cancer patients, either as an indication of disease or as a symptom of the disease. This is the first book to focus on this unique area of cancer care, providing international, evidence-based, clinical guidance for the

whole team involved in treating the cancer patient with oral problems.

Oral Oncology Oxford University Press, USA

Background Brachytherapy is a treatment option for base of the tongue cancer. This includes external radiation- and brachytherapy in form of pulsed dose rate radiation, and in most cases a neck dissection. Brachytherapy is given every two hours 24 hours a day via permanent catheters during 3.5 days. The aim of the study was to describe how people diagnosed with base of tongue cancer experience the time after combination therapy with external radiation therapy and brachytherapy.

Method The study has a qualitative method with a descriptive design. Data was collected by semi

structured interviews. Eight participants who received brachytherapy against base of tongue cancer were interviewed. The analysis was conducted with qualitative content analysis. ResultsThe patients described how they had a changed body that led to a new life which required new solutions in their everyday life. Dry mouth affected their life to a greater extent than they were expecting. The relationship to food and taste changed, as it lost its pleasure and changed their social context. Their energy declined and the patients were unprepared for the increased inconvenience and the impact on life. Shoulder dysfunction after the neck dissection could limitate every day life. Uncertainty about if the side effects would be permanent as well as an

anxiety and fear that the cancer would return were present. ConclusionThe results of this study highlights that the impact of the treatment is greater than the participants expected. The result can provide insight into the problems that may arise for the patient after treatment as well as possibilities to tailor interventions targeting improvement in the information and care.

In spite of great advance made by ENT and maxillofacial surgeons as well as radiotherapists to improve therapy of cancer of the oral cavity and oropharynx, it has not been possible in the past 4 decades to raise the chances of patient survival above 40%-45%. However, recent studies with different combination therapies indicate that better results can be expected in the future. In this volume, the current status and results of therapeutic studies are presented by distinguished clinicians in the three disciplines. The book provides up-to-date information and encourages interdisciplinary cooperation.
