This book is the perfect gift for anyone with an interest in our scientific history. It exposes the theories that were once widely regarded as facts but have since been proven to be complete science fiction. From such seemingly crazy ideas as the body being composed of only four things—black and yellow bile, blood, and phlegm—to the discovery of dinosaur bones being accepted as the bones of giants killed in the great flood from Biblical times. They Got It Wrong: Science tells the fascinating story behind 50 erroneous scientific theories and gives incredible perspective on how the way we view the workings of the world has evolved throughout history.

Discover the science of forensics through Agatha Christie's novels in the ultimate true crime investigation Agatha Christie is the bestselling novelist of all time, and nearly every story she ever wrote involves one—or, more commonly, several—dead bodies. And the cause of death, the motives behind violent crimes, the clues that inevitably are left behind, and the people who put the pieces together to solve the mystery invite the reader to analyze the evidence and race to find the answer before the detective does. Nearly every step of the way, Christie outlines the nuts and bolts of early 20th-century crime detection, relying on physical evidence to tell the real story behind the facades humans erect to escape detection. Christie wouldn't have talked of "forensics" as it is understood today—most of her work predates the modern developments of forensics science—but in each tale she harnesses the power of human observation, ingenuity, and scientific developments of the era. A fascinating, science-based deep dive, *The Science of Murder* examines the use of fingerprints, firearms, handwriting, blood spatter analysis, toxicology, and more in Christie's beloved works. What readers are saying: "Highly entertaining with many fascinating snippets of insider information about real life criminal cases. This is a must for Christie fans." "Thoroughly researched and a delight to read!" "A wealth of information and knowledge to help give an insight to the golden age of crime fiction." "Absolutely brilliant book that looks at how Agatha Christie made use of developments in forensic science in her novels and upgraded her understanding over time." "Agatha Christie is one of my favorite authors, unparalleled in her clever plots and twisting tales. She was also a forensic expert, weaving into her novels human observation, ingenuity and genuine science of the era. This book illuminates all of Agatha's incredible knowledge, showing how she stayed at the cutting edge of forensic knowledge, as seen through her much loved characters." 2019 Best-Of Lists: 10 Best Science Books of the Year (Smithsonian Magazine) · Best Science Books of the Year (NPR's Science Friday) · Best Science and Technology Books from 2019" (Library Journal) An astute and timely examination of the re-emergence of scientific research into racial differences. Superior tells the disturbing story of the persistent thread of belief in biological racial differences in the world of science. After the horrors of the Nazi regime in World War II, the mainstream scientific world turned its back on eugenics and the study of racial difference. But a worldwide network of intellectual racists and segregationists quietly founded journals and funded research, providing the kind of shoddy studies that were ultimately cited in Richard Herrnstein and Charles Murray's 1994 title *The Bell Curve*, which purported to show differences in intelligence among races. If the vast majority of scientists and scholars disavowed these ideas and considered race a social construct, it was an idea that still managed to somehow survive in the way scientists thought about human variation and genetics. Dissecting the statements and work of contemporary scientists studying human biodiversity, most of whom claim to be just following the data, Angela Saini shows us how, again and again, even mainstream scientists cling to the idea that race is biologically real. As our understanding of complex traits like intelligence, and the effects of environmental and cultural influences on human beings, from the molecular level on up, grows, the hope of finding simple genetic differences between "races"—to explain differing rates of disease, to explain poverty or test scores, or to justify cultural assumptions—stubbornly persists. At a time when racialized nationalisms are a resurgent threat throughout the world, Superior is a rigorous, much-needed examination of the insidious and destructive nature of race science—and a powerful reminder that, biologically, we are all far more alike than different. **Popular Science Monthly** Chicago Review Press

Widely recognized as one of the West Coast's most important and critically acclaimed practitioners of conceptual and installation art, David Ireland (born 1930) has taken the concept of art itself as one of his subjects. A self-described "post-

discipline" artist, guided by Zen thought and postmodern aesthetics, Ireland moves fluidly from making small drawings to creating sculptures as large as houses. Freely incorporating anything within his conceptual or physical reach—dirt, concrete, wire, and other everyday materials—his work is subtle, puzzling, and witty, and consistently challenges traditional definitions of art. In this book accompanying the first full-scale retrospective of Ireland's work, curator and author Karen Tsujimoto provides an insightful overview of more than thirty years of the artist's accomplishments, from his drawings, sculptures, and site-specific installations to his remarkable series of architectural transformations, including his well-known house at 500 Capp Street in San Francisco. Chronicling Ireland's circuitous route to his calling, Tsujimoto explores how key life experiences have influenced his artistic perspective—from his early art-student days, through his years as an African importer and safari guide, to his long-standing interest in Eastern, and particularly Zen, philosophy and his deep connections with the San Francisco Bay Area conceptual art community. An illuminating essay by art historian and curator Jennifer R. Gross also considers Ireland's art in terms of historical materialism—assessing his use of neglected materials and artifacts as a process of cultural preservation.

 "Beliefs about men and women are as old as humanity itself, but Fine's funny, spiky book gives reason to hope that we've heard Testosterone rex's last roar."  
 —Annie Murphy Paul, New York Times Book Review  
 Many people believe that, at its core, biological sex is a fundamental force in human development. According to this false-yet-familiar story, the divisions between men and women are in nature alone and not part of culture. Drawing on

evolutionary science, psychology,  
neuroscience, endocrinology, and

philosophy, Testosterone Rex disproves  
this ingrained myth and calls for a more

equal society based on both sexes' full  
human potential.
