There is very little
discussion of socially just
approaches to speech-
language pathology.
Within other fields of

clinically-oriented
practice, social justice is a
topic that has received a
great deal of attention
within the last few years.
Pedagogy for addressing
social justice has been
developed in other
disciplines. The field of
communication disorders
has failed to move
forward and do the same.
Discussion of social justice

is important given the
current sociopolitical
climate and landscape
that clients carry out in
their day-to-day
functioning. Speech-
language pathologists
(SLPs) have an
opportunity to engage in
practices that help
address and alleviate
some of the injustices that
contribute to educational

and health disparities experienced by communities of color. They may do this through the development and application of a socially just orientation of culturally competent practice that fosters changes beyond the individual level. Adapting such a framework makes it possible for SLPs to effectively advocate for and foster equity and inclusion for the individuals and broader communities impacted by SLP services. Critical Perspectives on Social

Justice in Speech-Language Pathology addresses the socio-political contexts of how the field of speech-language pathology and service delivery can impact policy and debates related to social justice issues. It explores social position factors and the experiences of marginalized communities to explore how speech-language pathologists deliver services, train and prepare students, and carry out research in communities of color. It covers topic areas

including disproportionality in special education, disability rights and ableism, achievement and opportunity gaps, health disparities, and LGBTQ+ rights with a focus on voice, communication, and gender-diverse populations. This book is essential for speech-language pathologists, administrators, practitioners, researchers, academicians, and students interested in how the SLP profession and discipline can contribute to or develop

efforts to help address injustices faced by Black, Indigenous, and people of color (BIPOC) communities.

A pilot study examined caregivers' expectancies of their child's speech-language therapy prior to treatment. Specific caregiver and family characteristics (i.e. socioeconomic status, caregiver stress levels, and family status) were analyzed to determine if these predicted high or low expectancies of

speech-language therapy. Because of the low number of participants (15 respondents), the present study is not representative to draw conclusions about caregiver expectancies. Likely due to the small sample number, the lack of participation of single and low income caregivers, and the absence of ethnic minority participants, a relationship between caregiver expectancies and socioeconomic status, family status, ethnic status, and parenting

stress could not be determined. The results based on the small sample indicated that socioeconomic status, caregiver stress, and family status did not predict high or low expectancies. Despite the small sample, statistical significance was identified in caregivers' agreement to high expectancy statements and disagreement to low expectancy statements. Additional findings showed that 26.6% of the caregivers scored at a high total stress score.

Within the group of the 26.6% that scored at a high total stress score, 75% scored at an even higher total stress score indicating clinically significant levels of stress. Overall, the findings have implications for the need to understand caregiver stress, the factors that influence caregiver stress, and its impact on intervention and treatment outcomes. Rural Opportunities Jones & Bartlett Learning While numerous studies have illustrated healthcare disparities

within otolaryngology, few have progressed beyond detection. To move ahead, our specialty needs to advance our level of understanding and develop, implement, and disseminate successful interventions toward the goal of eliminating disparities. Healthcare Disparities in Otolaryngology offers comprehensive look at this important topic and its clinical impact on the practice of otolaryngology. After first covering specialty-wide

perspectives on factors that are associated with healthcare disparities in otolaryngology, it then focuses on subspecialty specific evidence. Editors and authors represent leading otolaryngology experts who have assembled the most up-to-date recommendations for managing healthcare disparities in the field. Covers The Influence of Healthcare System Organization on Healthcare Disparities in Otolaryngology; The Integration of Sex and Gender Considerations in

Otolaryngology; Understanding Rural-Urban Disparities in Otolaryngology; The Impact of Health Literacy on Patient Care in Otolaryngology; Hearing Health Disparities: Applying Social Epidemiologic Principles and New Approaches; Social Determinants of Health and Demographic Disparities in Rhinology; Disparities in the Diagnosis and Treatment of Obstructive Sleep Apnea; and much more. Presents a unique look at healthcare disparities

amongst special groups, such as the LGBTQ community and the geriatric population. Consolidates today's available information on healthcare disparities in otolaryngology into a single, convenient resource.

Speech-Language Pathologists in Early Childhood Intervention: Working with Infants, Toddlers, Families, and Other Care Providers

presents practicing clinicians and graduate students with the skills necessary to provide evidence-based best practice services to young clients struggling to gain functional communication skills and their families. It also serves to broaden the understanding of early intervention within the field of speech-language pathology. Through research, real life scenarios, and practical documents the text presents positive advocacy for this population. The text

begins with a general overview of the history and rationale for early childhood intervention, including the Individuals with Disabilities Education Act (IDEA), Part C program, and Early Head Start, as well as a description of the need for speech-language pathologists in early intervention. The majority of the text offers assessment and intervention strategies and tools, including specific tests and curricula, training resources, and the

importance of using ongoing assessment for this young age. Strategies for coaching parents and collaborating with professional colleagues as well as working within daily routines in natural environments for the child - all integral components of the Part C early intervention program - are interwoven throughout. The text concludes with the importance of viewing children holistically - taking into consideration all aspects of a child's being and acknowledging the interrelatedness of

their developing skills as well as the importance of family in their development. Speech-language pathologists have a critical role in evaluation, assessment, and intervention for young children with or at risk for communication disorders. Speech-Language Pathologists in Early Childhood Intervention creates a pathway for investing in the principles and activities of early intervention that can lead to best practice and positive outcomes for this

young population.

The Work of Play is an anthropological ethnography of children's play therapy that examines the experiences of a group of female therapists who implemented new psychotherapeutic programs in South Korea. Drawing from the anthropology of childhood, medical anthropology, the anthropology of play, and East Asian studies, this book explores how

therapists articulate expertise, community, and livelihood in contemporary Seoul. *Handbook of Speech-Language Therapy in Sub-Saharan Africa* Elsevier Health Sciences
Speech and language are central to the human experience; they are the vital means by which people convey and receive knowledge, thoughts, feelings, and other internal experiences. Acquisition of communication skills begins early in childhood and is foundational to the

ability to gain access to culturally transmitted knowledge, organize and share thoughts and feelings, and participate in social interactions and relationships. Thus, speech disorders and language disorders-disruptions in communication development-can have wide-ranging and adverse impacts on the ability to communicate and also to acquire new knowledge and fully participate in society. Severe disruptions in speech or language acquisition have

both direct and indirect consequences for child and adolescent development, not only in communication, but also in associated abilities such as reading and academic achievement that depend on speech and language skills. The Supplemental Security Income (SSI) program for children provides financial assistance to children from low-income, resource-limited families who are determined to have conditions that meet the disability standard required under law.

Between 2000 and 2010, there was an unprecedented rise in the number of applications and the number of children found to meet the disability criteria. The factors that contribute to these changes are a primary focus of this report. *Speech and Language Disorders in Children* provides an overview of the current status of the diagnosis and treatment of speech and language disorders and levels of impairment in the U.S. population under age 18. This study

identifies past and current trends in the prevalence and persistence of speech disorders and language disorders for the general U.S. population under age 18 and compares those trends to trends in the SSI childhood disability population.

Health Assistance for Low-income Children PMPH-USA

Telepractice, a branch of telehealth, which is the delivery of services to distant sites employing telecommunication, has been developing rapidly nowadays. Owing to the

nature of the condition and treatment foci in aphasia, telepractice has been identified as a potential mode for intervention to persons with aphasia (PWA) in the field of speech-language pathology. Based on the American Speech-Language Hearing Association (2005), telepractice is considered a means to extend services to a wider context overcoming the barriers of transportation, costs, and limited availability of services. Thus, exploration of

treatment accessibility to underserved populations in middle/low-income countries or rural areas via telepractice is warranted. The primary objectives of this study are to systematically review literature on telepractice of speech-language pathology services for PWA, with a focus to synthesize and analyze data that will be useful to low-income countries to consider telepractice as an alternate option and also to contribute to broaden the evidence base of

aphasia practices via telepractice and include the newest available evidence. A systematic review was conducted in this study following the guidelines of Cochrane Handbook (Higgins et al., 2020). The study utilized a systematic search based on PRISMA guidelines and included 11 articles following a thorough screen for eligibility. A pre-designed coding manual was utilized in order to extract relevant data. All the included studies evaluated the feasibility

of telepractice in intervention and to investigate the effectiveness of treatment programs conducted via teletherapy. A majority of the participants (72%) included in the review are PWA secondary to strokes. The treatment areas studies targeted are word retrieval, language skills, communication skills and language and communication skills, with communication skills being the area covered in highest number of studies. The review found that telepractice in the

targeted treatment programs is feasible and effective. However, the included articles lack strong methodological designs limiting the certainty of the evidence. Participant-perceived data indicated some advantages of telepractice, such as overcoming transport/cost barriers, receipt of higher intensity of treatment, and facilitations for non-verbal strategies to improve language and communication skills. In addition, the results revealed that all but one

of the included studies was completed in a high-income country. Most of the findings also lack adequate details on therapy receipt and delivery setting dynamics from a standpoint of replicating the studies or in order to generalize the findings. In conclusion, the current review shows limited evidence guidelines for the use of telepractice in rural and middle/low-income countries. There is a need to explore simple affordable technology options in telepractice

and evaluate their effectiveness in low/middle-income contexts. Empirical data on efficacy of telepractice for PWA drawn from strong methodological designs should also be considered to encourage evidence-based clinical practice using telepractice in those contexts.

Overcoming Apraxia Jones & Bartlett Publishers
Children living in poverty are more likely to have mental health problems, and their conditions are more likely to be severe. Of the approximately 1.3

million children who were recipients of Supplemental Security Income (SSI) disability benefits in 2013, about 50% were disabled primarily due to a mental disorder. An increase in the number of children who are recipients of SSI benefits due to mental disorders has been observed through several decades of the program beginning in 1985 and continuing through 2010. Nevertheless, less than 1% of children in the United States are recipients of SSI disability

benefits for a mental disorder. At the request of the Social Security Administration, Mental Disorders and Disability Among Low-Income Children compares national trends in the number of children with mental disorders with the trends in the number of children receiving benefits from the SSI program, and describes the possible factors that may contribute to any differences between the two groups. This report provides an overview of the current status of the

diagnosis and treatment of mental disorders, and the levels of impairment in the U.S. population under age 18. The report focuses on 6 mental disorders, chosen due to their prevalence and the severity of disability attributed to those disorders within the SSI disability program: attention-deficit/hyperactivity disorder, oppositional defiant disorder/conduct disorder, autism spectrum disorder, intellectual disability, learning disabilities, and mood

disorders. While this report is not a comprehensive discussion of these disorders, *Mental Disorders and Disability Among Low-Income Children* provides the best currently available information regarding demographics, diagnosis, treatment, and expectations for the disorder time course - both the natural course and under treatment. *Speech, Language, Learning, and the African American Child* Seachange Publishing Group, LLC

This book showcases cutting-edge research papers from the 7th International Conference on Research into Design (ICoRD 2019) – the largest in India in this area – written by eminent researchers from across the world on design processes, technologies, methods and tools, and their impact on innovation, for supporting design for a connected

world. The theme of ICoRD'19 has been “Design for a Connected World”. While Design traditionally focused on developing products that worked on their own, an emerging trend is to have products with a smart layer that makes them context aware and responsive, individually and collectively, through collaboration with other physical and digital objects with which these are connected. The papers in this volume explore these themes, and their key focus is

connectivity: how do products and their development change in a connected world? The volume will be of interest to researchers, professionals and entrepreneurs working in the areas on industrial design, manufacturing, consumer goods, and industrial management who are interested in the use of emerging technologies such as IOT, IIOT, Digital Twins, I4.0 etc. as well as new and emerging methods and tools to design new products, systems and

services.
