Online Consumer Psychology addresses many of the issues created by the Internet and goes beyond the topic of advertising and the Web to include topics such as customization, site design, word of mouth processes, and the study of consumer decision making while online. The theories and research methods help provide greater insight into the processes underlying consumer behavior in online environments. Broken into six sections, this book: focuses on community and looks at the Internet's ability to bring like-minded individuals from around the world into one forum; examines issues related to advertising, specifically click-through rates and advertising content placed within gaming online and wireless networks; provides readers with reasons why consumers customize products and the benefits of customization; discusses the psychological effects of site design; asks the question of whether the Internet empowers consumers to make better decisions; and discusses research tools that can be used online.

 In order to bridge the gap between artificial and synthetic intelligence, we must first understand our own intelligence. 'What is intelligence?' might appear as a simple question, but many great minds have agreed that there is no singular answer. Unlocking Consciousness attempts to examine this central question through exploring the convergence of computing, philosophy, cognitive neuroscience and biogenetics. The book is the first of its kind to compare comprehensive definitions of both information and intelligence, an essential component to the advancement of computing into the realms of artificial intelligence. In examining explanations for intelligence, consciousness, memory and meaning from the perspective of a computer scientist, it offers routes that can be taken to augment natural and artificial intelligence, improving our own individual abilities, and even considering the potential for creating a prosthetic brain. Unlocking Consciousness demonstrates that understanding intelligence is not just for the benefit of computer scientists, it is also of great value to those working in evolutionary, molecular and systems biology, cognitive neuroscience, genetics and biotechnology. In unlocking the secrets of intelligence and laying out the methods of which

information is structured and processed, we can unlock a completely new theory of consciousness. For additional published articles and appendices referenced in this title, readers can visit www.brainmindforum.org/ for further information.

This volume is part of a publication series emerging from an international interdisciplinary study group on "New Technologies and Work (NeTWork)". NeTWork is sponsored by the Werner-Reimers Foundation (Bad Homburg, Germany) and the Maison des Sciences de l'Homme (Paris). The NeTWork study group has set itself the task of intellectually penetrating various problem domains posed by the introduction and spread of new

technologies in work settings. This problem focus requires interdisciplinary co-operation. The usual mode of operating is to identify an important problem within the NeTWork scope, to attempt to prestructure it and then to invite original contributions from European researchers or research teams actively involved in relevant analytic or developmental work. A specific workshop serves to cross-fertilize the different approaches and to help to integrate more fully the individual contributions. The concept of telematics refers to the integration of computer, telecommunication and information technologies. It alludes to the opportunities presented by the technical means to communicate and transfer data over large distances by "intelligent equipment". Teleshopping, teleconferencing, teleworking and telebanking are but a few examples of a development which influences both public and private environments. Both households and workplaces are likely to be thoroughly changed by telematics. This publication emphasises the application of telematics in working environments. The central questions of the book are: How will the present and future development of telematics effect the nature and organization of work, and under which conditions will this development be optimal? From the various contributions it is clear that telematics is not a single direct cause or determinant of particular changes in work and organization. The development and application of telematics depend on decision making of actors at a political scene both outside and inside the work organizations. The effects of the use of these applications appear to be co-determined by many other factors. In fact, the technology interacts with political, economic, and social factors in a complex process that shapes new organizational forms and work relationships.

"Digital transformation" sounds harmless, given that the explosion in data volumes, processing power and Artificial Intelligence has driven humanity and the entire world to a point of

no return. We will surely see a new civilization, but we are at a crossroads. The future needs to be re-invented, decisions must be taken. After the automation of factories and the creation of self-driving cars, the automation of society is on its way. But there are two kinds of automation: a centralized top-down control of the world and a distributed control approach, supporting local self-organization. Using the power of today's information systems, governments and big tech companies seem to engage in the first approach. Might they even build a „digital Crystal Ball“ that knows almost everything, including your personality, and a super-intelligent "digital God" to control what we do? We are much closer to such „science fiction scenarios“ than you probably think. In this much expanded second edition of *"The Automation of Society is Next: How to Survive the Digital Revolution"* (2015), the author discusses lessons learned on digital democracy, aspects of transhumanism and far-reaching thoughts about life in the digital age and what it may mean to be human in the future.
