Lippincott Williams & Wilkins

Vital Signs for Cancer Prevention suggests that cancer is a two-phase process. In Phase One you do not yet have, and may never have, cancer, but predisposing factors—poor diet and digestion, toxins, adrenal exhaustion, and blood sugar imbalances, among others—can progressively and cumulatively increase your likelihood of developing it. Phase Two begins when the first permanent, transformed or cancerous cells form and are not destroyed by your defenses. Understanding that the predisposing factors of the first phase lead toward the second can help you prevent the onset of cancer by correcting or minimizing those that apply to you. Author Xandria Williams takes a natural therapies approach to healing cancer—one based on an understanding of nutrition, herbal medicine, homoeopathy, osteopathy, and energy medicine—rather than one based strictly on medicine, drugs, and surgery. She sees cancer as a problem that affects the whole body, not just the organ or system that is faulty, and thus her recommendations are systemic rather than aimed specifically at the tumor. Her main emphasis is on a series of scientifically validated tests (many of which can be self-administered) she proposes that provide vital information as to the state of your health. She also describes the CA profile, a test that can indicate the presence of permanent cancer cells within the first six weeks and possibly years before a tumor can be detected, allowing a crucial warning and the time to start an effective recovery program. Williams suggests a number of supplements, specific foods, and other remedies (detox procedures, stress reduction) to correct any of the predisposing

factors that could, with a final trigger, move you from Phase One to Phase Two of the cancer process. You will learn how to avoid cancer if you have not yet developed it, avoid recurrences if you are in remission, and overcome cancer if you have been diagnosed with it.

#### Cancer Biomarkers in Body Fluids Springer Nature

The main goal in compiling this book was to highlight the situation in Africa in terms of AIDS and opportunistic diseases. Several chapters reveal great poverty, an apocalyptic situation in many parts of Africa. Global migration of people resulted in their exposure to pathogens from all over the world. This fact has to be acknowledged and accepted as African reality. New, unconventional hypotheses, not determined by established dogmas, have been incorporated into the book, although they have not yet been sufficiently validated experimentally. It still applies that any dogma in any area of science, and medicine in particular, has and always will hinder progress. According to some biologists, in the future, AIDS is very likely to occur in a number of variations, as a direct result of the ongoing processes in the global human society. Thus, we urgently need a comprehensive solution for AIDS, in order to be ready to fight other, much more dangerous intruders.

The ability to measure and monitor cancer biomarkers in "body fluid biopsy" should greatly impact oncologic practice. "Biomarkers in Proximal Fluids", the third of the "Cancer Biomarkers in Body Fluids" series details cancer signatures in none or minimally circulating body fluids including saliva, sputum, bronchoalveolar lavage fluid, exhaled breath condensate, nipple aspirate fluid, gastric and pancreatic juice, stool, urine, and prostatic, peritoneal and cerebrospinal fluid. These fluids are enriched with biomarkers, especially those emanating from cells of the proximal tissue. Chapter 1 examines the global burden of cancer and the need for regional efforts at primary prevention, early detection and patient care. Chapters 2-12 address tissue-specific biomarkers in associated body fluids. The tumor interstitial fluid as a microenvironment rich in cancer biomarkers is detailed in chapter 13, while chapter 14 looks at the human

body fluid microbiome and its evolving role in cancer.

Commercially available assays using proximal fluids are examined at the end of the respective chapters. This book complements its predecessors and is equally useful to oncologists, cancer researchers, clinicians, medical students, nurses, diagnostic laboratory and pharmaceutical industry personnel.
