How communication technologies meant to empower people with speech disorders—to give voice to the voiceless—are still subject to disempowering structural inequalities. Mobile technologies are often hailed as a way to “give voice to the voiceless.” Behind the praise, though, are beliefs

about technology as a gateway to opportunity and voice as a metaphor for agency and self-representation. In *Giving Voice*, Meryl Alper explores these assumptions by looking closely at one such case—the use of the Apple iPad and mobile app Proloquo2Go, which converts icons and text into synthetic speech, by children with disabilities (including autism and cerebral palsy) and their families. She finds that despite claims to empowerment, the hardware and software are still subject to disempowering structural inequalities. Views of technology as a great equalizer, she illustrates, rarely account for all the ways that culture, law, policy, and even technology itself can reinforce disparity, particularly for those with disabilities. Alper explores, among other things, alternative understandings of voice, the surprising sociotechnical importance of the iPad case, and convergences and divergences in the lives of parents across class. She shows that working-class and low-income parents understand the app and other communication technologies differently from upper- and middle-class parents, and that the institutional ecosystem reflects a bias toward those

more privileged. Handing someone a talking tablet computer does not in itself give that person a voice. Alper finds that the ability to mobilize social, economic, and cultural capital shapes the extent to which individuals can not only speak but be heard.

Interventional Cardiology Elsevier Health Sciences

A practical, highly illustrative and easy to read reference for interventional cardiologists, vascular surgeons, cardiac/endovascular catheterization laboratory personnel, interventional radiologists, technical staff, industry

professionals, investigators, and researchers on peripheral arterial CTO interventions. Peripheral CTO lesions are present in nearly 50% of all peripheral arterial disease (PAD) endovascular interventions. There is tremendous growth in the performance and learning of peripheral arterial CTO procedures. There are several ongoing physician courses and many others that are being prepared;

however, there is a significant lack of standardized selection, strategies, techniques and equipment necessary to achieve a high degree of reproducible success with low complication rates during the performance of these complex and technically challenging endovascular procedures. The book is not an academic “tour de force” description of the topic but

rather a practical one with many illustrations and step-by-step explanations of the various procedure steps, what can go wrong, and troubleshooting. Heavy use of illustrations throughout limit the text to what is necessary to convey the message, and the book is supported by online case catalogues and board review questions. The book also includes never-before-published information on new technology.
