This quantitative evaluation study endeavored to determine the effectiveness of the ability-grouped math classes at ABC Elementary. The main research question for this study was "Is the current practice of ability grouping in sixth-grade math at ABC Elementary a system that promotes academic gains on standardized tests and a positive self-efficacy in math for all students?" Research in the area of ability grouping suggested that leveling students by ability could promote social inequalities and academic consequences. While other studies in this field have found that different types of grouping students may benefit them. The math class participants in this research study were 211 sixth-grade math students enrolled in ABC Elementary over the period of three years, from 2010-2013. The researcher analyzed growth on fifth and sixth-grade standardized tests for growth, and middle school math placement test scores to chart gains or losses for sixth-grade students. A self-efficacy survey was also used to determine if students were in agreement with their math class placement and whether they were developing a positive self-efficacy in math while participating in their homogeneous math class. The conclusions of this study were that majority of students at ABC Elementary were performing well in math and had developed a positive self-efficacy. However, the findings also suggested that not all students felt their current math class challenged them, and that students participating in the accelerated class were experiencing a larger percentage of academic score declines than the other math class levels.

Advanced math coursework can affect college and labor market outcomes, yet discretionary placement policies can lead to differential access at key points in the college preparatory pipeline. We examine a targeted approach to course assignment that uses prior test scores to identify middle school students

deemed qualified for a college preparatory math sequence. Accelerated math placement of relatively low-skilled middle schoolers increases the fraction later enrolling in Precalculus by one-seventh, and by over one-third for female and non-low income students. Acceleration increases college readiness and intentions to pursue a bachelor's degree. Course placement rules based on objective measures can identify students capable of completing rigorous coursework but whom discretionary systems might overlook.

Questions about how best to place students into appropriate middle grade math courses have been central to ongoing education policy and practice discussions in California and across the United States. Recent studies have shown that enrolling in algebra I in grade 8 works well for some students but backfires for others. This REL West report provides findings from a study of placements that were based on different test scores available for middle school students in California. Findings indicate that placement into grade 8 algebra I based solely on students' grade 6 California Standards Test (CST) proficiency status results in some students taking the course who have less than a 40 percent chance of succeeding. Using a higher cut point on the grade 6 CST scale score--as opposed to simply using CST proficiency status--would avoid placing students into grade 8 algebra I who have a lower than 50 percent chance of success, and would increase the overall success rate (from 69 to 75 percent) for students placed into grade 8 algebra I. Prediction accuracy is even higher using grade 7 CST scale scores (78 percent); however, grade 7 scale scores are typically not available until after initial algebra I placements are made. The study also finds that a newly available assessment of algebra readiness developed as part of the Math Diagnostic Testing Project (MDTP) makes a valuable contribution to decisions about algebra I placement. Placements based on the MDTP result in a success rate (77 percent) that is comparable to that of placements based on the grade 7 math CST. Furthermore, the MDTP test can be administered online at any time during the school year, and MDTP test results are available immediately after students take the test,

whereas CST results are not available until the next school year. The following are appended: (1) Detailed study design; and (2) Model comparisons.
