Over the past quarter century Congress, state legislatures and the courts have radically reshaped America's laws dealing with sex offenders in an effort to reduce the prevalence of sex offenses. Most convicted sex offenders must now register with the authorities, who then make information about them available to the public.

Possession of child pornography has been made an extremely serious crime often punishable by prison sentences that dwarf those meted out to child molesters, rapists, robbers, and even killers. Federal law now imposes a minimum sentence of ten years in prison for those convicted of using the internet to

attempt to lure minors for sex. And the federal government and 20 states have "sexually violent predator" laws that allow the indefinite civil commitment of convicted sex offenders to secure institutions for treatment after they have served their full criminal sentences. All of these changes in sex offender law, as well as numerous others, have been based at least in part on input from psychology, psychiatry and the social sciences. Moreover, enforcement and administration of many of these laws relies to a large extent on the efforts of mental health professionals. However, many questions about this involvement remain largely unanswered.

Are these laws supported by empirical evidence, or even by well-reasoned psychological theories? Do these laws actually work? Are mental health professionals capable of reliably determining an offender's future behavior, and how best to manage it? Finally, are experts capable of providing effective treatment for sex offenders -- i.e., treatment that actually reduces the likelihood that an identified sex offender will re-offend? In *Justice Perverted*, Charles Patrick Ewing poses these difficult questions and others that few in either law or psychology have asked, much less tried to answer. Drawing on research from across the social and behavioral sciences, he

weighs the evidence for the spectrum of sex offense laws, to occasionally surprising results. A rational look at an intensely emotional subject, *Justice Perverted* is an essential book for anyone interested in the science behind public practice.

There is a tremendous information gap between scientists working in the outdoor

fields and the millions of others who share their interest in natural processes. The failure of naturalists to provide information to the public has allowed some amazing myths to develop. Far worse, however, this knowledge gap can bring about actual damage to the environment through laws and public policy initiatives based on erroneous information. *Growing Up Wild* bridges this gap, bringing the latest results of scientific research to the public in an irreverent, humorous style that would make the book worth reading for entertainment value alone. The author, who combines careers as a wildlife professional and newspaper columnist, provides an

eclectic mix of topics from toads to turkeys in a style that, while always humorous, ranges from gonzo journalism to formal poetry sometimes in the same essay. Many of the essays contained in the book began life as one of the authors weekly newspaper columns. These were supposed to focus on a single organism and give some interesting facts about it. That is, they were supposed to be typical nature pieces. The questions that came in, in response to the original columns, seemed to indicate that people were not even reading all the way through. So he changed the format to start out with some outrageous tale to pique the interest (and make people wonder

how on earth this was going to segue to the real topic), move on to the main topic, then hook back to the anecdote at the end. The response was quite overwhelming. Since the material in this book has a mix of early and more recent columns, the reader can watch this style develop. There is something for everyone in this collection of essays. Topics range from single-celled organisms to whales. In addition to recreational reading, this book provides excellent supplementary material for students. In spite of the humor and light tone, each essay provides an in-depth look into the lives of our wild neighbors, as well as making some pointed

commentary on the culture and political processes that affect them.

This volume contains the proceedings of the U.S. Australia workshop on Complex Interconnected Biological Systems held in Albany, Western Australia January 1-5, 1989. The workshop was jointly sponsored by the Department of Industry, Trade and Commerce (Australia), and the National Science Foundation (USA) under the US-Australia agreement. Biological systems are typically hard to study mathematically. This is particularly so in the case of systems with strong interconnections, such as ecosystems or networks of neurons. In

the past few years there have been substantial improvements in the mathematical tools available for studying complexity. Theoretical advances include substantially improved understanding of the features of nonlinear systems that lead to important behaviour patterns such as chaos. Practical advances include improved modelling techniques, and deeper understanding of complexity indicators such as fractal dimension. Game theory is now playing an increasingly important role in understanding and describing evolutionary processes in interconnected systems. The strategies of individuals which affect

each other's fitness may be incorporated into models as parameters. Strategies which have the property of evolutionary stability result from particular parameter values which may be the main feature of living determined using game theoretic methods. Since systems is that they evolve, it seems appropriate that any model used to describe such systems should have this feature as well. Evolutionary game theory should lead the way in the development of such methods.

Burmese pythons are invading Florida. These enormous snakes are native to Southeast Asia, so when one

showed up dead along the side of a Florida highway in 1979, scientists wondered where it came from. No one knew the snakes had launched a full-scale invasion. Pet pythons that escaped or were released by their owners started breeding in the wild, and these enormous predators began eating every animal in their path. Today a group of scientists at the Conservancy of Southwest Florida is tracking Burmese pythons to find ways to stop their spread. Page Plus QR code links lead to video clips and photos of the scientists working in the field. Delve into the science of pythons and their role as invasive predators. The massive grassy African savanna is filled with the hunting activity of predators and their prey. The stamina of the hyena allows the animal to hunt its prey until it is too tired to fight. The lion's strength makes its attacks swift and severe. But which animal is the fiercest of the ecosystem?

Compare and contrast each animal's features and skills before you declare the winning predator.

This groundbreaking tour de force presents the gripping, true account of one of America's most notorious serial rapists and the tough female journalist assigned to cover his case.

Following an exhaustive manhunt and his capture in 2005, Brent Brents sent letters and his journal to Denver Post reporter Amy Herdy—with the condition that she alone tell his story. Here, then, in his raw and uncensored words, Brents reveals shocking details about his childhood abuse and the monstrous acts

he later committed. Going way beyond just the facts, he gives us an unprecedented look inside the twisted mind of a sociopath. At the same time, Amy has a personal story to tell. Rocked to the core by Brents' disturbing case, she sets out to understand this ruthless criminal only to be confronted with her own troubled past. Ultimately, she must make a choice that will change her life forever.

' This book focuses on a prototype of creative causal processes termed BIOS and how the concept can be applied to the physical world, in medicine and in social science. This book presents methods

for identifying creative features in empirical data; studies showing biotic patterns in physical, biological, and economic processes; mathematical models of bipolar (positive and negative) feedback that generate biotic patterns. These studies support the hypothesis that natural processes are creative (not determined) and causal (not random) and that bipolar feedback plays a major role in their evolution. Simple processes precede, coexist, constitute and surround the complex systems they generate (priority of the simple). In turn, complex processes feedback and transform simpler ones (supremacy of the complex).
