Atlas of Moral Psychology University of Chicago Press

This original and engaging book advocates an unabashedly empirical approach to understanding human values: abstract ideals that we consider important, such as freedom, equality, achievement, helpfulness, security, tradition, and peace. Our values are relevant to everything we do, helping us choose between careers, schools, romantic partners, places to live, things to buy, who to vote for, and much more. There is enormous public interest in the psychology of values and a growing recognition of the need for a deeper understanding of the ways in which values are embedded in our attitudes and behavior. How do they affect our well-being, our relationships with other people, our prosperity, and our environment? In his examination of these questions, Maio focuses on tests of

theories about values, through observations of what people actually think and do. In the past five decades, psychological research has learned a lot about values, and this book describes what we have learned and why it is important. It provides the first overview of psychological research looking at how we mentally represent and use our values, and constitutes important reading for psychology students at all levels, as well as academics in psychology and related social and health sciences.

Freidson guides his analysis by finding what power may be ascribed to formal, codified knowledge. He focuses on the institutions that provide intellectual workers with their knowledge, a regular living, organized political resources, and other means with which to translate formal knowledge into human activity. Surveying professionals, he establishes a basic foundation for tracing the sources and means of professional power. Key issues are discussed as to whether they exercise power in the workplace, in government policy-making, and in the shaping of our physical and social world.

When a number of enormous explosions rock both his region and a major shopping mall in Tel Aviv, Noel Parke, director of the New York office of the Department of Homeland Protection, can at first find nothing to link them. Yet his investigation soon makes it clear that they are merely precursors to a terrorist attack intended to devastate the entire city. Parke has learned only that "earthquakes" are coming, a code word for an unimaginably massive assault years in the planning. But before he can hope to thwart the attack, he must identify what connects the previous explosions. And he must uncover the exact nature of the plot despite the grudging opposition of a powerful political enemy within his own department. Parke's chances seem hopeless, yet the cost of failure is incalculable.

EPPP Secrets Study Guide SAGE

This 'Open Access' SpringerBrief provides foundational knowledge for designing autonomous, asynchronous systems and explains aspects of users relevant to designing for these systems,

introduces principles for user-centered design, and prepares readers for more advanced and specific readings. It provides context and the implications for design choices made during the design and development of the complex systems that are part of operation centers. As such, each chapter includes principles to summarize the design implication that engineers can use to inform their own design of interfaces for operation centers and similar systems. It includes example materials for the design of a fictitious system, which are referenced in the book and can be duplicated and extended for real systems. The design materials include a system overview, the system architecture, an example scenario, a stakeholder analysis, a task analysis, a description of the system and interface technology, and contextualized design guidelines. The guidelines can be specified because the user,

the task, and the technology are well specified as an example. Building Better Interfaces for Remote Autonomous Systems is for working system engineers who are designing interfaces used in high throughput, high stake, operation centers (op centers) or control rooms, such as network operation centers (NOCs). Intended users will have a technical undergraduate degree (e.g., computer science) with little or no training in design, human sciences, or with human-centered iterative design methods and practices. Background research for the book was supplemented by interaction with the intended audience through a related project with L3Harris Technologies (formerly Harris Corporation).
