Digital photography, MP3, digital video, etc. make extensive use of NAND-based Flash cards as storage media. To realize how much NAND Flash memories pervade every aspect of our life, just imagine how our recent habits would change if the NAND memories suddenly disappeared. To take a picture it would be necessary to find a film (as well as a traditional camera...), disks or even magnetic tapes would be used to record a video or to listen a song, and a cellular phone would return to be a simple mean of communication rather than a multimedia console. The development of NAND Flash memories will not be set down on the mere evolution of personal entertainment systems since a new killer application can trigger a further success: the replacement of Hard Disk Drives (HDDs) with Solid State Drives (SSDs). SSD is made up by a microcontroller and several NANDs. As NAND is the technology driver for IC circuits, Flash designers and technologists have to deal with a lot of challenges. Therefore, SSD (system) developers must understand Flash technology in order to exploit its benefits and countermeasure its weaknesses. Inside NAND Flash Memories is a comprehensive guide of the NAND world: from circuits design (analog and digital) to Flash reliability (including radiation effects), from testing issues to high-performance (DDR) interface, from error correction codes to NAND applications like Flash cards and SSDs.

This book presents the latest cutting edge research, theoretical methods, and novel applications in the field of computational intelligence and computational biological approaches that are aiming to combat COVID-19. The book gives the technological key drivers behind using AI to find drugs that target the virus, shedding light on the structure of COVID-19, detecting the outbreak and spread of new diseases, spotting signs of a COVID-19 infection in medical images, monitoring how the virus and lockdown is affecting mental health, and forecasting how COVID-19 cases and deaths will spread across cities and why. Further, the book helps readers understand computational intelligence techniques combating COVID-19 in a simple and systematic way. Provides a comprehensive reference covering innovations and development of theories, conceptual models and computational algorithms focused on COVID-19; Asserts all relevant research, key themes, complex adaptive systems, metrics and paradigms dedicated towards COVID-19, enabled with evolutionary methods of computational sciences; Explores how AI and computational techniques can help to predict which patients with the virus would go on to develop Acute Respiratory Distress Syndrome (ARDS). *2021 International Symposium on VLSI Design, Automation and Test (VLSI DAT)* Springer Nature For most countries, economic development involves a process of 'catching up' with leading countries at the time. This is never achieved solely by physical assets and labour alone: also needed are the accumulation of technological capabilities, educational attainment, entrepreneurship, and the development of the necessary institutional infrastructure. One element of this infrastructure is the regime of intellectual property rights (IPR), particularly patents. Patents may promote innovation and catch up, and they may foster formal technology transfer. Yet they may also prove to be barriers for developing countries that intend to acquire technologies through imitation and reverse engineering. The current move to harmonize the IPR system internationally, such as the TRIPS agreement, may thus have unexpected consequences for developing countries. This book explores these issues through an in depth study of eleven countries ranging from early developers (the USA, Nordic Countries and Japan), and Post World War 2 countries (Korea, Taiwan, Israel) to more recent emerging economies (Argentina, Brazil, China, India and Thailand). With contributions from international experts on innovation systems, this book will be an invaluable resource for academics and policymakers in the fields of economic development, innovation studies and intellectual property laws.

National Health Education Standards Auteur Publishing in Partnership with Liverpool University Press This book gathers selected papers presented at the Inventive Communication and Computational Technologies conference (ICICCT 2019), held on 29–30 April 2019 at Gnanamani College of Technology, Tamil Nadu, India. The respective contributions highlight recent research efforts and advances in a new paradigm called ISMAC (IoT in Social, Mobile, Analytics and Cloud contexts). Topics covered include the Internet of Things, Social Networks, Mobile Communications, Big Data Analytics, Bio-inspired Computing and Cloud Computing. The book is chiefly intended for academics and practitioners working to resolve practical issues in this area.

The story of *The Usual Suspects* has the kind of "rags to riches" back story that makes not only the film itself, but the tale of its creation a tale worth telling. Inspired by a magazine headline, it was a poster before it was a screenplay, yet it stands in opposition to the High Concept Hollywood movie. Studying *The Usual Suspects* is an analysis of a film that is both a ripping yarn and an exercise in virtuoso technique. Author Judith Gunn offers: a thorough introduction to semiotics as a way of approaching the multiple meanings of the film; a consideration of the film's noir antecedents and influences; a discussion of the film's playful approach to narrative; an overview of John Ottman's unique role as both composer and editor and how this affects the finished article, including a shot-by-shot analysis of the dramatic and mysterious opening sequence; and a definitive account of the film's genesis from idea to film festival acclaim.

The chips in present-day cell phones already contain billions of sub-100-nanometer transistors. By 2020, however, we will see systems-on-chips with trillions of 10-nanometer transistors. But this will be the end of the miniaturization, because yet smaller transistors, containing just a few control atoms, are subject to statistical fluctuations and thus no longer useful. We also need to worry about a potential energy crisis, because in less than five years from now, with current chip technology, the internet alone would consume the total global electrical power! This book presents a new, sustainable roadmap towards ultra-low-energy (femto-Joule), high-performance electronics. The focus is on the energy-efficiency of the various chip functions: sensing, processing, and communication, in a top-down spirit involving new architectures such as silicon brains, ultra-low-voltage circuits, energy harvesting, and 3D silicon technologies. Recognized world leaders from industry and from the research community share their views of this nanoelectronics future. They discuss, among other things, ubiquitous communication based on mobile companions, health and care supported by autonomous implants and by personal carebots, safe and efficient mobility assisted by co-pilots equipped with intelligent micro-electromechanical systems, and internet-based education for a billion people from kindergarden to retirement. This book should help and interest all those who will have to make decisions associated with future electronics: students, graduates, educators, and researchers, as well as managers, investors, and policy makers. Programming in C is close to the machine and the language was originally designed to code an operating system. The approach I take is to start from the machine layer, though in less detail than in a computer organization or logic design book, using the MIPS instruction set to illustrate principles. The first part of the book uses C syntax as "pseudocode" while demonstrating how to convert high level language code to MIPS assembly language. The second part of the book introduces C in more detail, building on the MIPS part. While using C as "pseudocode" is not strictly in keeping with the spirit of pseudocode, which is meant to be sketchy and leave out a lot of detail, the idea is to introduce those not familiar with C-style languages to the notation ahead of the second part of the book where C is introduced properly. Why MIPS? The MIPS architecture is simple and relatively easy to understand, and in wide use in embedded systems. The SPIM simulator is a handy and free learning tool. Why C? It is in wide use, and closer to the machine than other popular languages with similar syntax. Learning the hardware-software interface in C is a lot easier than in a language with a managed memory system and complications like classes and objects. Topics covered in the MIPS part include memory organization, alternative approaches to stack frames, local and global variables, the heap and dynamic allocation, function calls including parameter passing and recursion, how C relates to machine code (e.g., arrays as pointers) and - a brief segue out of C space - how objects and methods are implemented. I cover objects because they provide a useful example of a dispatch table, and a basic understanding of how method calls could be implemented is useful given how widespread object-oriented languages are. The C part builds on this, introducing C in a little more detail including how formatted input and output work, basic C constructs, the UNIX command line (basics of scripting and make), program structure, calling library functions with function pointers and bit manipulations. The book is tested on a second-year class whose prior courses used C#, but it could be used in an introductory class. The machine organization component is not very detailed; the idea is to present just enough to support the programming concepts. The principle aims of the book are provide a foundation for understanding deeper programming concepts like recursion and the background for courses that require an understanding of the hardware-software interface like compilers and operating systems. The index contains separate entries for

exercises so you do not waste time looking up a concept only to find the index entry points to an exercise. The test of how well this works is in how well students do in follow-up courses - so far, my experience has been positive and I hope yours is too.

In 1986 Frank Davis wrote his first poem. His thoughts were of our attitudes toward the Indians and how we infringed on their territories and lives. Most movies depict the Indian as bad and we were led to believe they were our enemies. Reading more realistic books gave him a different view. In many instances the Indians were friendly and helped pioneers in stress. In two of his poems he brings out his own version of their real struggles of the invasion of the white man, to be out numbered and controlled in a no-win situation. Then his thoughts of his childhood and memories of growing up, his slant on life and visions in a folklore atmosphere. His love and feelings of life and mother nature, to read his poetry will acquaint us with the Inner person and will remind us of ourselves in many ways. His first twenty poems were recorded and a friend listened to that first tape and exclaimed, 'Frank, it's just like being there,' hence the name Just Like Being There. In 1993 he married his best friend and was inspired to try writing lyrics to show his true colors to her. She is his biggest fan and finally someone to add rhythm to his life. Maybe some time in the future, one or two of his lyrics will be put to music.
