Since *Canis lupus familiaris* first shared a fire with man more than 15,000 years ago, dogs have been trusted and valued coworkers. Yet the relatively new field of canine ergonomics is just beginning to unravel the secrets of this collaboration. As with many new fields, the literature on working dogs is scattered across several non-overlapping disciplines from forensics and the life sciences to medicine, security, and wildlife biology. *Canine Ergonomics: The Science of Working Dogs* draws together related research from different fields into

an interdisciplinary resource of science-based information. Providing a complete overview, from physiology to cognition, this is the first book to discuss working dogs from a scientific perspective. It covers a wide range of current and potential tasks, explores ergonomic and cognitive aspects of these tasks, and covers personality traits and behavioral assessments of working dogs. A quick look at the chapters, contributed by experts from across the globe and across the multidisciplinary spectrum, illustrates the breadth and depth of information available in this book. Traditionally, information concerning working dogs is mostly hearsay, with the exchange of information informal at best and non-existent at worst. Most books available are too general in coverage or conversely, too specific. They explain how to train a service dog or train a dog to track, based on training lore rather than empirical methods verified with rigorous scientific standards. This book, drawing on cutting edge research, unifies different perspectives into one global science: *Canine Ergonomics*.

Scholars in folklore and anthropology are more directly involved in various aspects of medicine—such as medical education, clinical pastoral care, and negotiation of transcultural issues—than ever before. Old models of investigation that artificially isolated "folk medicine," "complementary and alternative medicine," and "biomedicine" as mutually exclusive have proven too limited in exploring the real-life complexities of health belief systems as they observably exist and are applied by contemporary Americans. Recent research strongly suggests that individuals construct their health belief systems from diverse sources of authority, including community and ethnic tradition, education, spiritual beliefs, personal experience, the influence of popular media, and perception of the goals and means of formal medicine. *Healing Logics* explores the diversity of these belief systems and how they interact—in competing, conflicting, and sometimes remarkably congruent

ways. This book contains essays by leading scholars in the field and a comprehensive bibliography of folklore and medicine.

In most peroxisomal disorders the nervous system is severely affected which explains the clinical and community burden they represent. This is the first book to focus not only on the mutations causing these inherited illnesses, but also on mechanisms that regulate, suppress or enhance expression of genes and their products (enzymes). Indeed since the success and completion of the Human Genome Project all genes (coding DNA sequences) are known. However, of many, their function, and the role of the gene product has not been determined. An example is X-linked adrenoleukodystrophy, the most frequent peroxisomal disorder. Children are born healthy, but in more than 1 out of 3, demyelination of the brain starts unpredictably and they die in a vegetative state. The gene mutated in most families has been known for 10 years; but the true role of the encoded protein, ALDp, is still speculative; and within the same family, very

severe and asymptomatic clinical histories co-exist, unexplained by the mutation.

 The purpose of this Information Publication is to provide owners, operators, sponsors, and other entities charged with oversight of GA landing facilities with a set of security best practices and a method for determining when and where these enhancements would be appropriate. Regarding GA, a few definitions are

in order: GA, as used in this document, means all civil aviation except for scheduled passenger and scheduled cargo service and military aviation. Airports, as used in this document, means an area of land or water that is used or intended to be used for the landing and takeoff of aircraft, and includes its buildings and facilities, if any. However, this document does not apply to airports required to comply with the provisions of 49 CFR 1542 or military airports. This document does not contain regulatory language. It is not intended to suggest that any recommendations or guidelines contained herein might be considered as mandatory requirements to be imposed upon GA facilities or operators, nor are these recommendations and guidelines intended to suggest any specific or general criteria to be met in order to qualify for Federal funding. The intent of this document is to provide a tool that enables GA landing facility managers to assess vulnerabilities and tailor appropriate security measures to their environment -- not to 'stigmatize' airports in any way.

ART treatment is vulnerable to the hazard of potential infection from many different sources: patients, samples, staff and the environment. Culture of gametes and embryos in vitro provides multiple targets for transmission of potential infection, including the developing embryo, neighbouring gametes and embryos, the couple undergoing treatment and other couples being treated during the same period. This unique situation, with multifaceted opportunities for microbial growth and transmission, makes infection and contamination control absolutely crucial in the practice of assisted reproduction, and in the laboratory in particular. Originally published in 2004, this practical book provides a basic overview of microbiology in the context of ART, providing a guide to infections in reproductive medicine. The relevant facets of the complex and vast field of microbiology are condensed and focused, highlighting information that is crucial for safe

practice in both clinical and laboratory aspects of ART.

Introduction to Security has been the leading text on private security for over thirty years. Celebrated for its balanced and professional approach, this new edition gives future security professionals a broad, solid base that prepares them to serve in a variety of positions. Security is a diverse and rapidly growing field that is immune to outsourcing. The author team as well as an outstanding group of subject-matter experts combine their knowledge and experience with a full package of materials geared to experiential learning. As a recommended title for security certifications, and an information source for the military, this is an essential reference for all security professionals. This timely revision expands on key topics and adds new material on important issues in the 21st century environment such as the importance of communication skills; the value of education; internet-related security risks; changing business paradigms; and brand

protection. New sections on terrorism and emerging security threats like cybercrime and piracy Top industry professionals from aerospace and computer firms join instructors from large academic programs as co-authors and contributors Expanded ancillaries for both instructors and students, including interactive web-based video and case studies Airport Development Reference Manual Elsevier Health Sciences The screening of airport passengers & their checked baggage is a critical component in securing our nation's commercial aviation system. This report incorporates results from a survey of 155 Federal Security Directors -- the ranking Transportation Security Admin. (TSA) authority responsible for the leadership & coordination of TSA security activities at the nation's commercial airports. This report addresses: (1) actions TSA has taken to enhance training for passenger & checked baggage screeners & screening supervisors, (2) how TSA ensures that screeners complete required training, & (3) actions TSA has taken to measure &

The focus of restorative policing is within a community-oriented policing approach, where the police have important tasks in rendering services to the population. Traditional forms of penal treatment no longer satisfy entirely, especially in relation to nuisances, incivilities, and petty crime. Is the community police officer the simple 'registrator' of events between victim and offender? Can s/he take the role of mediator, or can s/he refer to external instances in the domain of mediation or to civil judges? Do the police have their own restorative regulations and institutionalized practices, and are they involved in mediation in penal matters? In what ways do police officers contribute to informal restorative practices and conflict resolution in neighborhoods? This book is about restorative policing practices, and the place and role police forces can take in this kind of approach.

The book is a compilation of selected papers from 2020 International Conference on Electrical and Electronics Engineering (ICEEE 2020) held in National Power Training Institute HQ (Govt. of India) on February 21 - 22, 2020. The work focuses on the current development in the fields of electrical and electronics engineering like power generation, transmission and distribution, renewable energy sources and technology, power electronics and applications, robotics, artificial intelligence and IoT, control, and automation and instrumentation, electronics devices, circuits and systems, wireless and optical communication, RF and microwaves, VLSI, and signal processing. The book is beneficial for readers from both academia and industry. Practices to Protect Bus Operators from Passenger Assault Springer
Motor dysfunction and cognitive impairment are major symptoms in both Huntington's Disease (HD) and Parkinson's Disease (PD). A breakthrough in

HD research was the identification of the gene that causes this devastating monogenetic illness. Similarly, several genes were found to cause familial forms of PD. With their identification, a plethora of genetic animal models has been generated and has revolutionized the understanding of the pathobiology and pathophysiology of these disorders. The models allow us to study the earliest manifestations of the diseases behaviorally and neuropathologically and help us understand how they progress over time. Additionally, neurotoxic animal models are still of high interest to the PD field, as they are being used to study e.g. mitochondrial dysfunction in PD. This book focuses on animal models of both diseases and how they have helped and will continue to help understand the behavioral neurobiology in these disorders.
