Effects of Wing-body Geometry on the Lateral-flow Angularities at Subsonic Speeds

Penguin

This book explains and elaborates upon the procedure of endoscopic dacryocystorhinostomy in a variety of indications. It systematically deals with the anatomy of the lacrimal drainage system, covering all aspects of gross, endoscopic and radiological anatomy. It discusses extensively on the preoperative assessment involving clinical and radiological evaluation as it is a crucial step towards achieving a successful dacryocystorhinostomy. It uses a lot of clinical and schematic diagrams of the surgical steps, simplifying the layout of the procedure and thus making it very easy for the eye and ENT surgeons to follow the technique. The book covers from basic to the most advanced and minimally invasive procedures like dacryoendoscopy and balloon dacryoplasty. It also provides a few handy tips for the upcoming young oculoplastic surgeons, ENT surgeons and postgraduate students.

The lateral flow characteristics in the region of a vertical tail have been investigated experimentally and theoretically at low subsonic speeds. The effects of changes in wing-body geometry such as nose position and shape, fuselage cross-sectional shape, and wing vertical position are described. The theoretical model which approximates the separated flow phenomena by a simple cylinder-vortex flow is described in an appendix.

Drawing Portraits CRC Press

First published in 1950, this is a vintage guide to making classic stuffed toys by hand. With simple, step-by-step instructions and dozens of imaginative projects, this profusely-illustrated guide will appeal to anyone with an interest in hand making toys—no matter what their skill level. Contents include:

"Consideration of the suitability of materials", "Progressive work", "Scales patterns", "Clothing", "Tools and Equipment: No special tools or equipment", "Materials for pattern-making. Materials: Suitability", "List of materials", "Materials for accessories", "Stuffing", "Kapok and other types of fillings. Accessories: Faces, hair, and squeakers", etc. Many vintage books such as this are increasingly scarce and expensive. It is with this in mind that we are republishing this volume now in an affordable, modern, high-quality edition complete with a specially-commissioned new introduction on the history of toys.

To keep abreast with current developments in medicine, members of the health care team require a firm grasp of science to cope with changes in technology and understanding of the mechanisms of body function. This is in addition to developing a range of interpersonal and communication skills. There are sections covering biology, chemistry, physics, nutrition, biochemistry, medical microbiology and physiology. Highly illustrated, it includes over a hundred applications and examples to assist the reader in relating science to health care. Throughout, the text is divided into units containing a common theme, and each chapter contains a list of objectives and a summary.

Comprehensive Overview of Advances in Olfaction The common belief is that human smell perception is much reduced compared with other mammals, so that whatever abilities are uncovered

and investigated in animal research would have little significance for humans. However, new evidence from a variety of sources indicates this traditional view is likely overly simplistic. The Neurobiology of Olfaction provides a thorough analysis of the state-of-the-science in olfactory knowledge and research, reflecting the growing interest in the field. Authors from some of the most respected laboratories in the world explore various aspects of olfaction, including genetics, behavior, olfactory systems, odorant receptors, odor coding, and cortical activity. Until recently, almost all animal research in olfaction was carried out on orthonasal olfaction (inhalation). It is only in recent years, especially in human flavor research, that evidence has begun to be obtained regarding the importance of retronasal olfaction (exhalation). These studies are beginning to demonstrate that retronasal smell plays a large role to play in human behavior. Highlighting common principles among various species – including humans, insects, *Xenopus laevis* (African frog), and *Caenorhabditis elegans* (nematodes) – this highly interdisciplinary book contains chapters about the most recent discoveries in odor coding from the olfactory epithelium to cortical centers. It also covers neurogenesis in the olfactory epithelium and olfactory bulb. Each subject-specific chapter is written by a top researcher in the field and provides an extensive list of reviews and original articles for students and scientists interested in further readings.

Scientist Without A Laboratory Springer Nature

Many advances have been made in the last decade in the understanding of the computational principles underlying olfactory system functioning.

Neuromorphic Olfaction is a collaboration among European researchers who, through NEUROCHEM (Fp7-Grant Agreement Number 216916)—a challenging and innovative European-funded project—introduce novel computing paradigms and biomimetic artifacts for chemical sensing. The implications of these findings are relevant to a wide audience, including researchers in artificial olfaction, neuroscientists, physiologists, and scientists working with chemical sensors. Developing neuromorphic olfaction from conceptual points of view to practical applications, this cross-disciplinary book examines: The biological components of vertebrate and invertebrate chemical sensing systems The early coding pathways in the biological olfactory system, showing how nonspecific receptor populations may have significant advantages in encoding odor intensity as well as odor identity The redundancy and the massive convergence of the olfactory receptor neurons to the olfactory bulb A neuromorphic approach to artificial olfaction in robots Reactive and cognitive search strategies for olfactory robots The implementation of a computational model of the mammalian olfactory system The book's primary focus is on translating aspects of olfaction into computationally practical algorithms. These algorithms can help us understand the underlying behavior of the chemical senses in biological systems. They can also be translated into practical applications, such as robotic navigation and systems for uniquely detecting chemical species in a complex background. Courier Corporation

This volume presents a novel logic-based, simplified understanding and approach to the external nose and face for aesthetics, airway, and sleep treatments that have mostly been under-recognized in the past. Key features of the text include an engineer's approach to simple rhinoplasty, (Release, Resize, Reposition, Reinforce) instead of the typical step-wise procedure algorithm. It also includes a logical explanation of how facial skeletal anatomy is the true cause of sleep apnea and aesthetic deformity with the physics and evidence of how

this works, and a review of conventional rhinoplasty/facial structural treatments, with an analysis of why these are flawed and need improvement. Finally, rhinoplasty surgical strategy is discussed using a Rhinoplasty Compass(TM) diagram. Rethinking Rhinoplasty and Facial Surgery appeals to the surgeon who has grown frustrated with the aesthetic and breathing results of the conventional treatment paradigm. It also appeals to the otolaryngologist, plastic or oral surgeon who avoids working on the external nose and nasal valve because of the perceived complexity of graft-style rhinoplasty or oversimplicity and limitations of basic septoplasty and turbinate reduction. This book provides a hybrid approach to the nose and face that provides more reliable and straightforward outcomes via an understanding of framework.

Practical Cosmophonography Penguin
This supercool paper airplanes ebook contains the best planes you have ever seen! These 12 paper planes are easy to build— then the fun begins! Awesome paper planes include: The sci-fi inspired Thunder Bird is a technological marvel and an incredibly easy plane to assemble! The colorful Dragonfly has a unique 4-wing structure—highly unusual for a paper airplane! The high-tech SpaceShipTwo has a fuselage just like the real-life Virgin Galactic rocket ship. Unlike other origami airplanes, these are ready to go in under a minute, with no messy glue or tape required! A full-color instruction book provides clear information about each model and tips on how to fine-tune the planes to get better performance. Head right outdoors with this collection and have many hours of high-flying fun!
