X-Ray Anatomy describes as well as illustrates the elementary and advanced radiological anatomy. This book presents the radiograph of the various parts of the human body, including the head, neck, upper limb, lower limb, abdomen, thorax, and the vertebral column. Organized into eight chapters, this book begins with an overview of the four classical methods of inspection, percussion, palpation, and auscultation. This text then describes the structure of the human skeleton, including its physical properties and its appearance in the radiograph. Other chapters consider the surface contours and skeletal landmarks of the shoulder and arm. This book discusses as well the condition of spina bifida, which is accompanied by anomalies of the spinal cord. The final chapter deals with several diagrams showing the radiographs of the larynx, the skull, as well as the ventricular system of the brain. This book is a valuable resource for radiologists, physicians, surgeons, and internists.

The eighteenth-century practitioners of anatomy saw their own period as 'the perfection of anatomy'. This book looks at the investigation of anatomy in the 'long' eighteenth century in disciplinary terms. This means looking in a novel way not only at the practical aspects of anatomizing but also at questions of how one became an anatomist, where and how the discipline was practised, what the point was of its practice, what counted as sub-disciplines of anatomy, and the nature of arguments over anatomical facts and priority of discovery. In particular pathology, generation and birth, and comparative anatomy are shown to have been linked together as subdisciplines of anatomy. At first sight anatomy seems the most long-lived and stable of medical disciplines, from Galen and Vesalius to the present. But Cunningham argues that anatomy was, like so many other areas of knowledge, changed irrevocably around the end of the eighteenth century, with the creation of new disciplines, new forms of knowledge and new ways of investigation. The 'long' eighteenth century, therefore, was not only the highpoint of anatomy but also the endpoint of old anatomy.

This book tells the story of the thousands of corpses that ended up in the hands of anatomists in the late nineteenth and early twentieth centuries. Composed as a travel story from the point of view of the cadaver, this study offers a full-blown cultural history of death and dissection, with insights that easily go beyond the history of anatomy and the specific case of Belgium. From acquisition to disposal, the trajectories of the corpse changed under the influence of social policies, ideological tensions, religious sensitivities, cultures of death and broader changes in the field of medical ethics. Anatomists increasingly had to reconcile their ways with the diverse meanings that the dead body held. To a certain extent, as this book argues, they started to treat the corpse as subject rather than object. Interweaving broad historical evolutions with detailed case studies, this book offers unique insights into a field dominated by Anglo-American perspectives, evaluating the similarities and differences within other European contexts.

The authors examine the relationship between the cultural, religious and social situation of German Jews on the one hand and their scientific activities on the other. They discuss the sensitive question of the specificity of the approaches of Jewish scientists and draw attention to the debate concerning the relationship between Judaism and academic research, ranging from the early 19th century theorizing on science and Judaism to 20th century issues, e.g. the controversies on 'Jewish' physics, mathematics etc. in the 1920s and 30s. The Anatomy of Dolphins: Insights into Body Structure and Function is a precise, detailed, fully illustrated, descriptive, and functionally oriented text on the anatomy and morphology of dolphins. It focuses on a number of delphinid species, with keynotes on important dolphin-like genera, such as the harbor porpoise. It also serves as a useful complement for expanding trends and emphases in molecular biology and genetics. The authors share their life-long expertise on marine mammals in various disciplines. Written as a team rather than being prepared as a collection of separate contributions, the result is a uniform and comprehensive style, giving each of the different topics appropriate space. Many color figures, which use the authors' access to wide collections of unique dolphin and whale material, round out this exceptional offering to the field. Includes high-quality illustrations, drawings, halftone artwork, photographic documentations, microphotos, and tables detailing dolphin anatomy, function, and morphology Facilitates education and training of students of all basic research and applied sciences dedicated to marine biology and the medical care of marine mammals Brings together the current knowledge and information on this topic, including those in obscure past or non-English publications, or scattered in short chapters in volumes Covers a number of delphinid species and serves as a useful complement for expanding trends in molecular biology and genetics

Education – An Anatomy of the Discipline focuses on the development of the discipline of education, how it is understood and practised in contemporary universities, and the potential threats to its future. As the author, John Furlong argues, disciplines are not only intellectually coherent fields of study; they also have a political life, they are argued for, supported, challenged and debated. Nowhere is this more true than in the discipline of education. In this authoritative text, Furlong describes the history as well as the current state of the discipline of education in universities. He also explores the range of national and global changes that have helped to shape the discipline in recent years. Education's final 'arrival' in the university sector coincided with major changes in universities themselves. Today, universities are very diverse institutions: they no longer have a sense of essential purpose and have largely accepted their loss of autonomy, especially in education where government intervention is particularly strong. If education is now fully integrated into universities, then, like the system as a whole, it urgently needs to find a voice, set out a vision for itself, and state what its purpose should be within a university in the modern world. The book therefore brings together four vitally important topics: -the changing nature of the university -the academic and scholarly study of education as a field -the professional education and training of teachers -the nature and organisation of educational research. Education – An Anatomy of the Discipline will occupy a central place in contemporary literature about education; although based on evidence from British universities, its implications are important across the world. The book will be invaluable reading for all professionals working in university departments and faculties of education as well as those with an interest in the changing role of the university in contemporary society.

Interdisciplinary research is a rewarding enterprise, but there are inherent challenges, especially in current anthropological study. Anthropologists investigate questions concerning health, disease, and the life course in past and contemporary societies, necessitating interdisciplinary collaboration. Tackling these 'big picture' questions related to human health-states requires understanding and integrating social, historical, environmental, and biological contexts and uniting qualitative and quantitative data from divergent sources and technologies. The crucial interplay between new technologies and traditional approaches to anthropology necessitates innovative approaches that promote the emergence of new and alternate views. *Beyond the Bones: Engaging with Disparate Datasets* fills an emerging niche, providing a forum in which anthropology students and scholars wrestle with the fundamental possibilities and limitations in uniting multiple lines of evidence. This text demonstrates the importance of a multi-faceted approach to research design and data collection and provides concrete examples of research questions, designs, and results that are produced through the integration of different methods, providing guidance for future researchers and fostering the creation of constructive discourse. Contributions from various experts in the field highlight lines of evidence as varied as skeletal remains, cemetery reports, hospital records, digital radiographs, ancient DNA, clinical datasets, linguistic models, and nutritional interviews, including discussions of the problems, limitations, and benefits of drawing upon and comparing datasets, while illuminating the many ways in which anthropologists are using multiple data sources to unravel larger conceptual questions in anthropology. Examines how disparate datasets are combined using case studies from current research. Draws on multiple sub-disciplines of anthropological research to produce a holistic overview that speaks to anthropology as a discipline. Explores examples drawn from qualitative, quantitative, and mixed methods research to illustrate the breadth of anthropological work.

For most of his career, Peter Swann's main research interest has been the economics of innovation. But he has also been preoccupied with a second question: what is the best way to study empirical economics? In this book, he uses his knowledge of the first question to answer the second. There are two fundamentally different approaches to innovation: incremental innovation and radical innovation - 'radical' in the sense that we go back to the 'roots' of empirical economics and take a different tack. An essential lesson from the economics of innovation is that we need both incremental and radical innovation for the maximum beneficial effect on the economy. Swann argues that the same is true for economics as a discipline. This book is a much-awaited sequel to *Putting Econometrics in its Place* which explored what other methods should be used, and why. This book is about the best way of organising the economics discipline, to ensure that it pursues this wide variety of methods to maximum effect.
