In the past several decades there has been remarkable progress in male reproductive medicine. The 2nd edition of this book on male hypogonadism provides a comprehensive yet focused view of testicular function and hormone

related abnormalities involving the male reproductive system. This book illustrates cutting edge knowledge on the diagnostics and therapeutic procedure for men with impaired testicular endocrine function. It provides in depth background information on anatomy and physiology of endocrine testicular function. The clinical presentation of male hypogonadism and all diagnostic procedures is described in detail. An extensive chapter deals with all aspects of androgen substitution therapy, including most recent and future developments. A separate chapter is devoted to androgen deficiency in the aging male. This book is ideally suited for the clinician in his strategic approach to the diagnosis and management of the androgen deficient patient.

An Introduction to Male Reproductive

Medicine is written specifically for readers seeking entry into this fast-moving, complex specialty with a solid understanding of the subject. The first chapters cover the anatomy and physiology, clinical evaluation, surgery, medicine, genetics and laboratory testing involved in the current evaluation and treatment of the infertile male, and the final chapter describes the interaction of the field with female reproductive medicine. Throughout the book, references are directly made to the fourth edition of the major text in the specialty, *Infertility in the Male*, edited by Larry Lipshultz, Stuart Howards and Craig Niederberger, allowing readers to expand their understanding of specific areas where desired. Each chapter is written by a well-renowned expert in an

easy to follow, informal style, making the text ideal for students, residents and general physicians who are seeking to increase their general knowledge of the field.

The new edition of this canonical text on male reproductive medicine will cement the book's market-leading position.

Practitioners across many specialties - including urologists, gynecologists, reproductive endocrinologists, medical endocrinologists and many in internal medicine and family practice - will see men with suboptimal fertility and reproductive problems. The book provides an excellent source of timely, well-considered information for those training in this young and rapidly evolving field. While several recent books provide targeted 'cookbooks' for those in a male reproductive laboratory, or quick reference for practising generalists, the modern, comprehensive reference providing both a background for male reproductive medicine as well as clinical practice information based on that foundation has been lacking until now. The book has been extensively

revised with a particular focus on modern molecular medicine. Appropriate therapeutic interventions are highlighted throughout.

*Human Reproductive Biology* focuses on the processes, concerns, and trends in human reproduction. Divided into four parts with 19 chapters, the book starts by tracing the history of human reproduction biology and the questions and choices involved. The first part focuses on the male and female reproductive systems. The text notes the different organs involved in reproduction, including the penis, scrotum, vagina, oviducts, and mammary glands. The book discusses sexual development and differentiation, particularly noting the variance of sex ducts and glands, external genitalia, and

disorders of sexual development and determination. The text also looks at puberty. Concerns include gonadal changes from birth to puberty; mechanisms that influence puberty; and puberty and psychosocial adjustment. The second part deals with menstrual cycle, fertilization, pregnancy, labor, and birth. Some of the concerns include length of menstrual cycle; absence of menstruation; transport of sperm and ovum in the oviduct; and semen release. The text also highlights labor and birthing processes as well as the relationship of neonates and parents. The third part looks at the medical aspects of human reproduction, infertility, and sexually transmitted diseases. Concerns include contraception, abortion, herpes genitalis,

and vaginitis. The text folds with discussions on human sexual behavior, population growth, and family planning. Concerns include sexual dysfunction; the effects of overpopulation; and population control. The book is a vital source of data for readers interested in human reproduction.

Academic Press

The human reproductive system is made up of the primary and secondary organs, which helps to enhance reproduction. The male reproductive system is

designed to produce male gametes and convey them to the female reproductive tract through the use of supportive fluids and testosterone synthesis. The paired testis (site of testosterone and sperm generation), scrotum (compartment for testis localisation), epididymis, vas deferens, seminal vesicles, prostate gland, bulbourethral gland, ejaculatory duct, urethra, and penis are the parts of the male reproductive system. The auxiliary organs aid in the maturation and transportation of sperm. Semen is made up of sperm and the secretions of the seminal vesicles, prostate, and bulbourethral glands (the ejaculate). Ejaculate is delivered to the female reproductive tract by the penis and urethra. The anatomy, embryology and functions of the male reproductive

system are discussed in this chapter.
