Nita's First Signs Little Hands Signing

Since the recent creation of a large-scale corpus of Italian Sign Language (LIS), a new research branch has been established to study the sociolinguistic variation characterizing this language in various linguistic domains. However, for nominal modification, the role of language-internal variation remains uncertain. This volume represents the first attempt to investigate sign order variability in this domain, examining what shapes the syntactic structure of LIS nominal expressions. In particular, three empirical studies are presented and discussed: the first two are corpus studies investigating the distribution and duration of nominal modifiers, while the third deals with the syntactic behavior of cardinal numerals, an unexplored area. In this enterprise, three different theoretical dimensions of inquiry are innovatively combined: linguistic typology, generative linguistics, and sociolinguistics. The research setup involves both quantitative and qualitative data. This mixed approach starts from corpus data to present the phenomenon,

examine linguistic facts on a large scale, and draw questions from these, and then looks at elicited and judgment-based data to provide valid insights and refine the analysis. Crucially, the combination of different methods contributes to a better understanding of the mechanisms driving nominal modification in LIS and its internal variation.

Furthermore, it is combined with novel in-depth studies of Russian Sign Language and Sign Language of the Netherlands. The book discusses how topic, focus, and contrast are marked in the visual modality and what implications this has for theoretical and typological study of information structure. Such issues as syntactic and prosodic markers of information structure and their interactions, relations between different notions of information structure, and grammaticalization of markers of information structure are highlighted. Empirical studies of the two sign languages also showcase different methodologies that are used in such research and discuss their advantages and disadvantages. Typological studies require a broad range of linguistic data from a variety of countries, especially developing nations whose languages are under-researched. This is especially challenging for investigations of sign languages, because there are no existing corpora for most of them, and some are completely undocumented. To examine three cross-linguistically fruitful semantic fields in sign languages from a typological perspective for the first time, a detailed questionnaire was generated and distributed worldwide through emails, mailing lists, websites and the newsletter of the World Federation of the Deaf (WFD). This resulted in robust data on kinship, colour and number in 32 sign languages across the globe, 10 of which are revealed in depth within this volume. These

comprise languages from Europe, the Americas and the Asia-Pacific region, including Indonesian sign language varieties, which are rarely studied. Like other volumes in this series, this book will be illuminative for typologists, students of linguistics and deaf studies, lecturers, researchers, interpreters, and sign language users who travel internationally.

American Sign Language: Units 10-18 John Wiley & Sons

The discovery of the importance of sign language in the deaf community is very recent indeed. This book provides a study of the communication and culture of deaf people, and particularly of the deaf community in Britain. The authors' principal aim is to inform educators, psychologists, linguists and professionals working with deaf people about the rich language the deaf have developed for themselves - a language of movement and space, of the hands and of the eyes, of abstract communication as well as iconic story telling. The first chapters of the book discuss the history of sign language use, its social aspects and the issues surrounding the language acquisition of deaf children (BSL) follows, and the authors also consider how the signs come into existence, change over time and alter their meanings, and how BSL compares and contrasts with spoken languages and other signed languages. Subsequent chapters examine sign language learning from a psychological perspective and other cognitive issues. The book concludes with a consideration of the applications of sign language research, particularly in the contentious field of education. There is still much to be discovered about sign language and the deaf community, but the authors have succeeded in providing an extensive framework on which other researchers can build, from which professionals can develop a coherent practice for their work with deaf people, and from which hearing parents of deaf children can draw the confidence to understand their children's world.
