Teach your baby how to communicate without words. Your baby has many wants and needs. Some you can figure out. Others need a little more patience. While your baby learns to make their requests verbally, you can teach them gestures and signs that will help bridge the gap of understanding. Baby Sign Language offers the tools and techniques you need to teach sign language to your baby. As a parent, you might have concerns about speech and language delays. Or you might be concerned that your baby hasn't started talking yet. Baby sign language is something that can promote early speech as well as speech development. This can be especially important for a baby diagnosed with autism or other language issues. This revised edition includes these features: -150 illustrations of popular signs to teach your baby -An express program for quicker results -Games and activities to make signing more fun -Expert advice on speech and language development Signing with your baby not only results in a happier and less frustrated child, but research also shows that learning sign language could help a child speak earlier and develop a higher IQ.

Bachelor Thesis from the year 2013 in the subject Computer Science - Software, grade: A+, language: English, abstract: The communication gap between the deaf and hearing population is clearly noticed. To make possible the communication between the Deaf and the hearing population and to overpass the gap in access to next generation Human Computer Interfaces, automated sign language analysis is highly crucial. Conversely, an enhanced solution is to build up a conversion system that translates a sign language gestures to text or speech. Exploration and experimentation of an efficient methodology based on facet features analysis. For a recognition system that can recognize gestures from video which can be used as a translation, A methodology has been proposed that extracts candidate hand gestures from sequence of video frames and collect hand features. The system has three separate parts namely: Hand Detection, Shape Matching and Hu moments comparison. The Hand Detection section detects hand through skin detection and by finding contours. It also includes processing of video frames. The procedure of shape matching is attained by comparing the histograms. The values of Hu moments of candidate hand region is identified using contour region analysis and compared to run matches and identify the particular sign language alphabet. Experimental analysis supports the efficiency of the proposed methodology on benchmark data.
