Antibiotics represent one of the most successful forms of therapy in medicine. But the efficiency of antibiotics is compromised by the growing number of antibiotic-resistant pathogens. Antibiotic resistance, which is implicated in elevated morbidity and mortality rates as well as in the increased treatment

costs, is considered to be one of the major global public health threats (www.who.int/drugresistance/en/) and the magnitude of the problem recently prompted a number of international and national bodies to take actions to protect the public (http://ec.europa.eu/dgs/health\_consumer/docs/road-map-amr\_en.pdf: http://www.who.int/drugresistance/amr\_global\_action\_plan/en; http://www.wh

itehouse.gov/sites/default/files/docs/carbonational\_strategy.pdf). Understanding the mechanisms by which bacteria successfully defend themselves against the antibiotic assault represent the main theme of this eBook published as a Research Topic in Frontiers in Microbiology, section of Antimicrobials, Resistance, and Chemotherapy. The articles in the eBook update the

reader on various aspects and mechanisms of antibiotic resistance. A better understanding of these mechanisms should facilitate the development of means to potentiate the efficacy and increase the lifespan of antibiotics while minimizing the emergence of antibiotic resistance among pathogens. Butterworth-Heinemann Medical Although 30% of the healthy human population is colonized with various Staphylococcus species, some staphylococcal strains, referred to as opportunistic pathogens, can cause minor to life-threatening diseases. The

pathogenicity of these bacteria depends on their virulence factors and the robustness of the regulatory networks expressing these virulence factors. Virulence factors of pathogenic *Staphylococcus* spp. consist of numerous toxins, enterotoxins (some of which act as superantigens), enzymes, and proteins (cytoplasmic, extracellular, and surface) that are regulated by two-component (TC) and quorum-sensing (QS) regulatory networks. To enter this niche, some other *Staphylococcus* species, such as *Staphylococcus simulans*, produce a potent endopeptidase called lysostaphin, which can inhibit the growth of pathogenic *S. aureus*. Some other *Staphylococcus* species produce autolysins and cationic peptides to win the intra- and inter-species competition. The outcome of this microbial invasion depends not only on pathogenic factors but also on the host's internal and external defense mechanisms, including a healthy skin microbiome. A healthy skin microbiome population can prevent colonization by other major pathogens. As normal host microflora, these commensals establish a

complex relationship with the host as well as the surrounding microbial communities. This Special Issue of Microorganisms is focused on studies and recent advancements in our understanding of staphylococcal virulence mechanisms that enable *Staphylococcus* spp. either to successfully establish themselves as a colonizer or to overcome the host's defense system to cause

infection along with our effort to make an anti-staphylococcal vaccine.

After two apparent failure of contact lens multipurpose solution in the mid 2000s, several manufacturers, such as Ciba Vision and CooperVision, have tried to reformulate new ingredients to ensure a safe and effective solution for the contact lens wearers.

RevitaLens, Biotrue, and OptiFree PureMoist are there newly launched multipurpose solutions that have been so far well-approved and used by patients and doctors. Each of these solutions was designed in their own specific ways to improve overall effectiveness in wettability of silicone hydrogel and traditional hydrogel lenses, comfort, removal of protein deposits, and

providing and effective disinfectant against organisms. The purpose of this study is to have an unbiased, update comparison in the disinfection active ingredients in each of the three newly launched multipurpose soft contact lenses solutions and the advantages that each solution attributes in the comfort and use for contact lens wearer. <p>"Essentials in Ophthalmology" is a new review series covering all of ophthalmology categorized in eight subspecialties. It will be published quarterly, thus each subspecialty will be reviewed biannually. Given the multiplicity of medical publications</p>	<p>already available, why is a new series needed? Consider that the half-life of medical knowledge is estimated to be around 5 years. Moreover, it can be as long as 8 years between the first description of a medical innovation in a peer-reviewed scientific</p>	<p>journal and publication in a medical textbook. A series that narrows this time span between journal and textbook would provide a more rapid and efficient transfer of medical knowledge into clinical practice, and enhance care of our patients.</p>
