While diagnosis with a neurological condition may not be life-threatening, it can have significant impact on everyday life and on participation in activities. Occupational therapists must be able to fully consider the physical, cognitive, emotional, psychological and behavioural problems which may occur as a consequence of a neurological disorder, and understand the

impact of diagnosis from a person-centred perspective. Occupational Therapy and Neurological Conditions incorporates theoretical, clinical and research evidence to support occupational therapists in the management of people with neurological conditions. Covers the key symptoms of neurological conditions and the biological basis of these within the ICF framework Provides an overview of therapy and management for all neurological conditions Includes key occupational therapy theory Case studies root concepts in real-life practice End-of-chapter self-evaluation questions help test understanding Occupational Therapy and Neurological Conditions is the ideal resource to support students, newly-qualified practitioners, and occupational therapists looking for an overview or introduction to this key area of practice.

Improved diagnostic sophistication is increasingly enabling neurologists to differentiate between Parkinson's disease and other atypical parkinsonism (AP), such as multiple system atrophy, progressive supranuclear palsy, corticobasal degeneration, and dementia with Lewy bodies. The Handbook of Atypical Parkinsonism is a comprehensive survey of all diseases of this category, providing an authoritative guide to the recognition, diagnosis and management of these disorders. Each chapter follows a common structure, commencing with the full basic science of the disorder under consideration, followed by descriptions of the clinical picture and differential diagnosis. Subsequent chapters discuss current and future therapeutic

approaches to these difficult conditions. Written and edited by leading practitioners in the field, clinicians in neurology and other specialties will find this book essential to the understanding and diagnosis of this complex group of disorders.

The WHO Falls Prevention for Active Ageing model provides an action plan for making progress in reducing the prevalence of falls in the older adult population. By building on the three pillars of falls prevention, the model proposes specific strategies for: 1. Building awareness of the importance of falls prevention and treatment; 2. Improving the assessment of individual,

environmental, and societal factors that increase the likelihood of falls; and 3. For facilitating the design and implementation of culturally appropriate, evidence-based interventions that will significantly reduce the number of falls among older persons. The model provides strategies and solutions that will require the engagement of multiple sectors of society. It is dependent on and consistent with the vision articulated in the WHO Active Ageing Policy Framework. Although not all of the awareness, assessment, and intervention strategies identified in the model apply equally well in all regions of the world, there are significant evidence-based strategies that can be effectively implemented in all regions and cultures. The degree to which progress will be made depends on the success in integrating falls prevention strategies into the overall health and social care agendas globally. In order to do this effectively, it is necessary to identify and implement culturally appropriate, evidence-based policies and procedures. This requires multi-sectoral, collaborations, strong commitment to public and professional education, interaction based on evidence drawn from a variety of traditional, complementary, and alternative sources. Although the understanding of the evidence-base is growing, there is much that is not yet understood. Thus, there is an urgent need for continued research in all areas of falls prevention and treatment in order to better understand the scope of the problem worldwide. In particular, more evidence of the cost-effectiveness of interconnections is needed to develop strategies that are most likely to be effective in specific setting and population sub-groups.

Recently, modified fitness boxing has become a popular activity for individuals with Parkinson's Disease to engage in. Unlike traditional exercise, modified fitness boxing allows for participants to engage in full body exercise, as well as remain engaged cognitively. The purpose of this study was to determine if participation in a modified fitness boxing class for individuals with Parkinson's Disease had an effect on overall quality of life. The study looked into specifics of completion of ADL/IADL activities and coping strategies before and after participation in the boxing program. Participants completed a paper survey containing multiple choice and short response questions pertaining to their experiences before and after partaking in the boxing class. Overall, participants did not report significant performance improvements with the majority of ADL activities that are related to quality of life. Nevertheless, every participant reported improvement in quality of life after participating in the modified fitness boxing program. While some improvements, such as in sleep, pain levels, and ability to complete routine needs, were associated with increased QOL, most participants reported QOL improvements were largely due to increased engagement in leisure and social participation, as a result from being a part of the boxing group. In addition, these leisure and social opportunities led to companionship, acceptance of disability and a sense of belonging. Given the results of this research, occupational therapists may not be able to justify incorporating group fitness boxing into interventions in order to improve ADL performance. However, leisure and social participation are two occupational areas that occupational therapists address. Considering the progressive nature of

Parkinson's, and the impact this has on treatment priorities, occupational therapists can use group fitness boxing with Parkinson's patients in an attempt to improve quality of life by increasing engagement in leisure and social participation. *Occupational Therapy Practice Guidelines for Adults with Neurodegenerative Diseases* John Wiley & Sons These practice guidelines draw upon the widest relevant knowledge and evidence available to describe and inform contemporary best practice occupational therapy for people with Parkinson's disease. Handbook of Atypical Parkinsonism SLACK Incorporated
Resources for rehabilitation specialists tend to follow a straight line: injury—disability—limitation—intervention. The International Handbook of Occupational Therapy Interventions breaks with this tradition, organized by type of intervention (based on recommendations in the International Classification of Functioning) rather than disability, medical condition, or level of impairment. This innovative, user-friendly system identifies

candidates for particular interventions in terms of the range of syndromes and illnesses they are applicable to, encouraging critical thinking, problem solving, and best practice. The book's wide spectrum of interventions coupled with its international perspective creates a unique source of evidence-based strategies for improving patients' adaptation, functioning, relearning, recovery, and the prevention of ill health. The Handbook: Describes interventions in such areas as environmental accessibility, ergonomics, pain management, sensory functional training, electric prostheses, music therapy, psychoeducation, and cognitive teaching. Features interventions suited to all areas of daily life: self maintenance, home, work, and leisure. Clarifies the occupational therapist's role in multidisciplinary care. Includes material on accident/illness prevention and health promotion strategies. Supplies reference lists of studies regarding the clinical efficacy of interventions. Demonstrates the use of a common technical language for the field. Occupational and physical therapists, rehabilitation nurses and technicians, psychiatrists, and health psychologists will find the International Handbook of Occupational Therapy Interventions a source of practice-enhancing tools and ideas. Its clarity of presentation makes it highly useful to readers in related fields (such as insurance case workers and ergonomic architects and engineers) as well.

The aim of this book is to provide a comprehensive overview of the most important movement disorders and describe the rehabilitation tools available for each disease. The management of movement disorders is challenging since most of these

diseases are not curable and hardly treatable. Many of the disorders are chronic or degenerative diseases, therefore patients develop motor complications that could improve with rehabilitation interventions. *Movement Disorders Rehabilitation* intends to serve as a practical guide on the field, attracting the interest of professionals and researchers on the fields of neurology, physical therapy, occupational therapy, speech therapy and other correlated therapies.

Occupational Therapy for People with Parkinson's Disease

Parkinson's Disease John Wiley & Sons

This book focuses on evidence-based occupational therapy in the care of older adults in different clinical settings, from home to acute hospital, from intensive care unit to rehabilitation centers and nursing homes. Occupational therapy has progressively developed as a new discipline aiming to improve the daily life of individuals of different ages, from children to older adults. The book first reviews the interaction between occupational therapy and geriatrics and then discusses in depth how occupational therapy interventions are applied in the community, in the acute

hospital and in the nursing home. It highlights the key role of occupational therapy in the management of frail patients, including critically ill older patients and persons with dementia, and describes in detail how to maintain occupational therapy interventions across different settings to avoid the fragmentation of care. The ageing population requires new innovative approaches to improve the quality of life, and as such this book provides clinicians with handy, key information on how to implement occupational therapy in the daily clinical care of older adults based on the current scientific evidence.
