Global Mental Health

World Health Organization
Work collected here was originally presented at the Second International Conference on Social Work in Health and Mental Health, held in Australia in January 1998. The collection is divided into concentrations on social policy, research, generic practice, and the practice fields of health and medical care, multicultural practice, and mental health. Reduced

reliance on residential service provision, cross-cultural research in palliative care, and multidisciplinary service provision are some of the issues discussed. Jackson holds the Chair of Social Work at the University of Melbourne. Segal teaches in the Schools of Social Welfare and Public Health at the University of California-Berkeley. This work has been co-published simultaneously as *Social Work in Health Care*, v. 34, nos. 1/2 and 3/4, 2001, and v.35, nos. 1/2, 2002. Annotation copyrighted by Book News, Inc., Portland, OR

Advances in Comparative Survey Methods IGI Global "[A] masterful volume that will do much to advance understanding

of mental health as an essential public health challenge." -*Journal of Sociology & Social Welfare* THE GROUNDBREAKING TEXTBOOK IN POPULATION-LEVEL MENTAL HEALTH, NOW FULLY REVISED AND UPDATED Public Mental Health equips a new generation of public health students, researchers and practitioners with the most innovative social, biological, and behavioral science approaches to mental health challenges at the population level. Incorporating insights from multiple health and science disciplines, this new edition introduces novel concepts and methodologies for understanding the occurrence of mental disorders in

populations worldwide. Reflecting the disciplinary diversity and expertise of an internationally-recognized roster of contributors, its nineteen chapters include coverage of such essential topics as:

- estimates of global prevalence based on new data from the Global Burden of Disease Study
- the complex way in which genes, other biological factors, and life stresses increase risk
- mental health disparities among population subgroups
- population-level mental health consequences of violence and natural disasters
- the logic and practice of prevention of mental and behavioral disorders

With a perspective that will resonate from the lab

to the legislature floor, Public Mental Health offers a much-needed core text for students, researchers, and practitioners.

Methods and Applications in Mental Health Surveys OECD Publishing

The definitive resource for survey questionnaire testing and evaluation Over the past two decades, methods for the development, evaluation, and testing of survey questionnaires have undergone radical change. Research has now begun to identify the strengths and weaknesses of various testing and evaluation methods, as well as to estimate the methods' reliability and validity. Expanding and adding to the research presented at the

International Conference on Questionnaire Development, Evaluation and Testing Methods, this title presents the most up-to-date knowledge in this burgeoning field. The only book dedicated to the evaluation and testing of survey questionnaires, this practical reference work brings together the expertise of over fifty leading, international researchers from a broad range of fields. The volume is divided into seven sections: Cognitive interviews
Mode of administration
Supplements to conventional pretests
Special populations
Experiments
Multi-method applications
Statistical modeling
Comprehensive and

carefully edited, this groundbreaking text offers researchers a solid foundation in the latest developments in testing and evaluating survey questionnaires, as well as a thorough introduction to emerging techniques and technologies. The WHO constitution states: "Health is a state of complete physical, mental and social well-being and not merely the absence of disease or infirmity." There are multiple factors that contribute towards good mental health including civil liberties, politics, economics, social rights, and cultural diversity, and quality of life of the individual and the society as a whole. The promotion of mental health spans many disciplines in order to cover all these factors such as education,

work, justice, housing, and welfare. Therefore, it is important to collaborate to create an environment that promotes and supports mental health to improve psychological well-being and allow individuals to realize their own abilities, work productively and contribute to society and live fulfilling lives. There is no health without mental health that is vital to individuals, families, communities, and societies across the world and so the goal of this Research Topic is to collate ideas and research of strategies for the promotion of mental health across all disciplines in order to raise awareness of mental health promotion and protection to ensure it's incorporation in

national mental health policies going forwards. This is of particular relevance given the mental health crisis being experienced across the world right now.

Measuring Population Mental Health

Psychology Press
Mental health researchers are increasingly looking towards digital health tools to gather day-to-day lived experiences of people living with mental health conditions, by using apps and wearable devices complementing episodic clinical assessments. One of the key goals of collecting longitudinal real-world multimodal data (RWD) is to help build personalized computational models that may help explain

the heterogeneity in clinical outcomes, mechanisms of action, and pathophysiology of mental health disorders across individuals.

Worldwide economic constraints on health care systems have highlighted the importance of evidence-based medicine and evidence-based health policy. The resulting clinical trials and

health services research studies require instruments to monitor the outcomes of care and the output of the health system. However, the over-abundance of competing measurement scales can make choosing a measure difficult at best. *Measuring Health* provides in-depth reviews of over 100 of the leading health measurement tools and serves as a guide for choosing among them. Now in its third edition, this book provides a critical overview of the field of health measurement, with a technical introduction and discussion of the history and future directions for the field. This latest edition updates the information on each of

the measures previously reviewed, and includes a complete new chapter on anxiety measurement to accompany the one on depression. It has also added new instruments to those previously reviewed in each of the chapters in the book. Chapters cover measurements of physical disability, social health, psychological well-being, anxiety, depression, mental status testing, pain, general health status and quality of life. Each chapter presents a tabular comparison of the quality of the instruments reviewed, followed by a detailed description of each method, covering its purpose and conceptual basis, its reliability and validity

and, where possible, shows a copy of the actual scale. To ensure accuracy of the information, each review has been approved by the original author of each instrument or by an acknowledged expert.

The chapters in this book focus on three

central themes: Current Challenges in Survey Development for People with Disabilities; Strategies to Promote Inclusion of People with Disabilities in Survey Development; and Issues for Future Development. The book is primarily a book for researchers and practitioners in the disability field. Since the topics presented in the book crosscut multiple disciplines and thus may be suited for students and experts of various disciplines. It hopefully also finds many interested readers among students and teachers of medical, social and disability sciences studies at colleges and universities. While some chapters highlight the currently unresolved barriers

towards obtaining accurate measurements for certain disability populations, others introduce innovative ways to plan for and to conduct inclusive surveys. In many instances, the work presented is work in progress and as such it is important in that it is expected to stimulate debate and future research work.

While there is increasing political interest in research and policy-making for global mental health, there remain major gaps in the education of students in health fields for understanding the complexities of diverse mental health conditions. Drawing on

the experience of many well-known experts in this area, this book uses engaging narratives to illustrate that mental illnesses are not only problems experienced by individuals but must also be understood and treated at the social and cultural levels. The book -includes discussion of traditional versus biomedical beliefs about mental illness, the role of culture in mental illness, intersections between religion and mental health, intersections of mind and body, and access to health care; - is ideal for courses on global mental health in psychology, public health, and anthropology departments and other health-related programs.

How much is enough in your sample? What is the difference between a research question and a survey question? By exploring the answers to these questions, this book shows readers how to specify inclusion and exclusion criteria in a sample, select the appropriate probability and non-probability sampling methods, understand the sources of error in sampling, and calculate the response rate. New to

this edition is coverage of sample size and power so that the reader can better understand the logic in determining the sample size to detect a difference if one exists. Filled with checklists and guidelines, this book will enable readers to select and use the most appropriate sampling methods for their survey. "Fink provides detailed descriptions of inclusion/exclusion criteria, the logic in estimating standard errors and sample size determination, and the sources of sampling errors." --Gerald Albaum, book review in *Journal of Marketing Research*

People with Disabilities
This document presents findings from a study conducted to examine the relationships between jails which were represented at the 1978 Special National Workshop on Mental Health Services in Local Jails and the various components of their local mental health systems. Chapter I explains the origins and scope of the study, describes the sample of 33 jails located in 26 states and methods of data collection, and provides an overview of monograph goals. Chapter II presents a distillation and review of current standards for jail mental health services as promulgated by different professional associations. Chapter

III describes mental health services that were available in study sites at the time of initial field work. Four distinctive approaches to service delivery are identified and capsule profiles of each type are included. Chapter IV analyzes responses to survey questions dealing with the perceived effectiveness of various organizational arrangements for providing inmate mental health services on study sites. Chapter V focuses on the frequency and scope of staff conflict among mental health and correctional personnel in study sites. Chapter VI addresses subsequent developments and changes made at study sites in the 12 to 18 months following initial

site visits. Chapter VII presents a summary and conclusions concerning study findings and their implications for mental health program planning for local jails. Lists of references, cases cited, and participating sites are included.

Public Mental Health

Rowman & Littlefield Publishers

The main objective of this work is to provide a book with high quality content that becomes a reference and support for graduate course (Mental Health, Public Health and Epidemiology) and for research in the domain of health economics applied to mental health. Also this book might be useful for policymakers on formulating mental

health policies. Key messages of this book are based on: a) mental illness represent a huge cost for society and for health care; b) health economics applied to mental health could help in the optimization of resource allocation for mental health care and for better decision making in terms of balancing costs and benefits; c) interventions and treatment should be also chosen in general medical practice and in public decision-policy according to cost-effectiveness, burden of disease and equity principles; d) quality of care is related with better outcomes, higher quality of life for clients, and with lower costs for society and health system (best

value for money); e) it is possible to decrease the burden of mental disorders with cost-effective treatments. The book is divided in four main topics: 1. Introduction to Health Economics applied to Mental Health - this section is an overview of basic principles, concepts and methods used in Economics and Health Economics to enable students to make critical appraisal of Health Economics texts and also to design research studies in this topic. 2. Health Economics applied to the evaluation of quality and costs of Mental Health Services - this section presents results of Brazilian studies on the costs of mental health care (hospital, outpatient care, residential care,

informal care), methods on the measurement of costs and it discusses issues related with public policies decisions and quality of mental health care in the low and middle income countries context. There is also an overview of quality indicators of mental health care and instruments to evaluate mental health services and costs.3. Health Economics applied to evaluate treatment of mental disorders - This section presents a review of cost-effectiveness of pharmacological treatments and other interventions applied for treating the most burdensome mental disorders such as depressive and anxiety disorders, bipolar disorders, psychosis,

alcohol and drug disorders, dementia, and hyper attention deficit disorders. 4. Health Economics, burden and indirect costs of mental disorders - This section highlights the social and economic burden caused by mental illness under societal perspective focusing on stigma, unemployment, indirect costs in the workplace (absenteeism and presenteeism), the relationship between poverty and mental disorders, global health and social determinants of mental health and on the costs of mental disorders (depression, anxiety, psychosis, alcohol and drug disorders). We present some instruments to measure indirect costs

of mental disorders.

Good mental health is a vital part of people's well-being, and the COVID-19 pandemic brought renewed attention to its importance. However, discussions so far have not focused sufficiently on how governments should best monitor it at the broader population level, and on how to consider both mental ill-health and positive mental states.

The World Health

Organization (WHO)

has identified mental health as an integral component of the

COVID-19 response. Its rapid assessment of service delivery for

mental, neurological and substance use (MNS) disorders during the COVID-19 pandemic, on which this report is based, is the first attempt to measure the impact of the pandemic on such services at a global level. The data were collected through a web-based survey completed by mental health focal points at ministries of health between June and August 2020. The questionnaire covered the existence and funding of mental health and psychosocial support (MHPSS) plans, the presence and composition of MHPSS coordination platforms, the degree of continuation and causes of disruption of different MNS services, the approaches used to

overcome these disruptions, and surveillance mechanisms and research on MNS data. **Understanding the Stigma of Mental Illness** Wiley-Interscience
This unique book presents original research from the largest cross-national survey of the epidemiology of mental disorders ever conducted. It provides the latest findings from the WHO World Mental Health Surveys based on interviews of nearly 150,000 individuals in twenty-six countries on six continents. The book is ordered by specific disorder, with individual chapters dedicated to presenting detailed findings on the prevalence, onset timing,

sociodemographic profile, comorbidity, associated impairment and treatment for eighteen mental disorders. There is also discussion of important cross-national consistencies in the epidemiology of mental disorders and highlighting of intriguing patterns of

cross-national variation. This is one of the most comprehensive summaries of the epidemiology of mental disorders ever published, making this an invaluable resource for researchers, clinicians, students and policy-makers in the fields of mental and public health.
